The 2008 Dayton Hamvention will be held this year on 16 - 18 May 2008. This is the 57th year of the Dayton Hamvention, sponsored by DARA (Dayton Amateur Radio Association). AMSAT will again occupy the same booths 444-448 plus a new booth 449, across from the ARRL area. It is anticipated that the attendance for Hamvention will be larger in 2008 than in previous years. Make your reservations early for all AMSAT activities!

As has been the case for the many years Hamvention will be at the Hara Arena Complex on the north side of Dayton. Further information on Hamvention 2008, including advance ticket sales and motel accommodations, can be found at www.hamvention.org.

AMSAT has a limited block of rooms reserved at the Hampton Inn in Fairborn, OH. Please contact Martha at the AMSAT office for room price and availability during Hamvention. Priority for rooms will be given to those volunteering to work in the AMSAT booth for multiple 2 hour shifts during Hamvention. The phone number for the AMSAT office is 301-589-6062 . Other hotels in the immediate area of the Hampton Inn include the Fairfield

Inn, Ramada Inn, Fairborn Holiday Inn, Red Roof Inn and the Homewood Suites if additional accommodations are needed.

1223. 2008 ARRL/TAPR Digital Communications Conference Issues Call for Papers

Yahoo group: DAWG-HSMM
Date: 2008-04-18 21:19:35 UTC
From: Mark Thompson
Topic: 1223 Message: 1223

2008 ARRL/TAPR Digital Communications Conference Issues Call for Papers (Apr 8, 2008) -- Technical papers are solicited for presentation at the 27th annual ARRL/TAPR Digital Communications Conference (DCC, http://www.tapr.org/dcc.html), Friday-Sunday, September 26-28, in Chicago, Illinois. Papers will also be published in the Conference Proceedings. Authors do not need to attend the conference to have their papers included in the Proceedings. The submission deadline is July 31. The ARRL/TAPR Digital Communications Conference is an international forum for technically minded radio amateurs to meet and present new ideas and techniques. Paper/presentation topic areas include -- but are not limited to -- software defined radio (SDR), digital voice, digital satellite communication, digital signal processing (DSP), HF digital modes, adapting IEEE 802.11 systems for Amateur Radio, Global Positioning System (GPS), Automatic Position Reporting System (APRS),
Linux in Amateur Radio, AX.25 updates and Internet operability with Amateur Radio networks. Submit papers to Maty Weinberg, KB1EIB, ARRL, 225 Main St, Newington, CT 06111 or via e-mail, maty@.... Papers will be published exactly as submitted, and authors will retain all rights. ARRL will provide additional information on the 2008 DCC as it becomes available.

1224. 08 Wild Ride Test

Yahoo group: DAWG-HSMM
Date: 2008-04-25 15:19:00 UTC
From: J. Beadles
Topic: 1224 Message: 1224

For the Richardson WildRide! Bike Rally this year, we're going to attempt to provide internet access to rest stops 2 & 3 using Wifi bridges from W5LT who lives on the west side of Lake Lavon. We'll be out starting to work it at about 9am tomorrow morning. The goal is to install the head end on the W5LT's 70 ft tower and then go to RS2 and RS3 to test.

Hams interested in participating should be in the Lake Lavon area somewhere in that time frame. We'll coordinate on the PARK 440 repeater, 444.25+ pl 79.7.

1225. Re: 08 Wild Ride Test

From: J. Beadles
Topic: 1224 Message: 1225

Due to a miscommunication, we won't be getting out in the morning as originally planned. Instead, we'll be heading out around 4pm.

1226. WRT54GL router rebate.

Yahoo group: DAWG-HSMM
Date: 2008-04-28 15:52:16 UTC
From: Kipton Moravec
Topic: 1226 Message: 1226

I just found out that Linksys has a rebate going on for the WRT54GL router which the best one to put DD-WRT on for HSMM connections. The Rebate expires April 30, and is valid for 2 units.

NewEgg.com has the best price I could find.
http://www.newegg.com/Product/Product.aspx?Item=N82E16833124190

$58.99 - $10.00 rebate = $48.99

Doug,

Glad to be on your list. I briefly talked to N5OOM after a presentation he gave here at Summerfest a couple of years ago.

We have a system of 2m / 440 voice and packet radio systems set up in the hospitals in Austin, and the system is now being expanded to other central Texas towns.

Our HSMM group has done some testing to augmenting some of the sites here in Austin, with HSMM links. The test results have been quite good. We building up a microwave mesh in our area.

Several of us work with the Texas Star Party each year. TSP is a gathering of ~800 astronomers from around the world that set up their gear and do observing from the Prude Ranch, near the McDonald Observatory in Ft. Davis TX. An AC power distribution grid is laid down, and Internet access is provided
via 802.11b, using 802.11a for back haul.

The TSP lasts a week so there is time to do some mountain top testing of our gear. It is a long drive and on the way back, two of us did some range, link and timeout experiments sending IP video between vehicles.

I have some reading to do as your group seems to be one of the few other HSMM / 802.11 groups I know of.

1228. HSMM in the Austin TX area

Yahoo group: DAWG-HSMM
Date: 2008-05-02 16:11:23 UTC
From: Glenn Currie
Topic: 1228 Message: 1228

Greetings from Glenn Currie, KD5MFW

The ARCHES system:
<http://www.your-website-in-24-hours.com/travishams/tcares.org/index.php?option=com_content&task=blogcategory&id=14&Itemid=26>

Has been working well. We originally installed stations at all 9 of the major hospitals in the Austin area(at this time the area is growing quickly and more hospitals and clinics are popping up all around here).

We have done a number of Simulated Emergency Tests with the City of Austin and Travis County EOC. The system worked very well. We were later contacted by a group of central Texas clinics who wanted to set up a similar system and tie into our ARCHES system.

The City of Austin and Travis County EOC is resource central for our area. If you can get them information on an emergency, they are in a position to deploy resources. By the time we get all the clinics in surrounding towns linked in, we will have something like 40 stations or more. With a 9 Austin area hospital SET, we soaked the available packet channels.

My suggestion, back in 2003 was to move some of the local traffic off of 2m / 440 and open up some fat pipes with microwave links - between locations where it was feasible. In a dense urban area like Austin, if you have good locations you can use HSMM to handle a lot of the local traffic, and leave the 2m / 440 frequencies for the folks in Taylor, Llano, San Marcos, Luling etc. to come in on. The links are slower, but the 2m / 440 propagation works like a champ for them - if they are not completely jammed with local Austin traffic. I continue to promote the idea and have some excellent help here in the Austin area.

We also have a couple of Winlink 2000 related stations in the area, one in Williamson County, just north of Austin, and one at the nice ham station they built for us at CTECC where the City of Austin and Travis County have their EOC. We also have the State of Texas EOC in town, and some of our group members help staff the ham station there. The NVIS links works well for a lot of situations that other modes do not.

As far as the consumer 802l.11 gear goes...

First we tried the 802.11b radios to see if they would be worth messing with. NG5V and I did some testing at the Canyon of the Eagles Observatory. We did a 1 mile link with little trouble - 30mw, WAP-11, 24dB dish on one end and 14db panel on the other end, connected to

a laptop PCMCIA card.

Some time later NG5V, AD5OO, and I met in a shopping mall parking lot in Austin, pulled up a topo map on a laptop and picked some likely high points in the area to try links.

We deployed and within an hour we had each set up our stations. I picked the parking garage of one of our ARCHES supported hospitals in south Austin. NG5V set up in NE Austin but was blocked by ground clutter (Trees).
I suggested AD5OO try from a particular parking garage I was familiar in north Austin. "You really want to go for the gusto! he said, that's 10 miles across downtown Austin". The path crossed over the super heavily 802.11 rich west campus area of The University of Texas.

Using the computer topo map I tried pointing my 24dB BBQ grill dish (salvaged) at NG5V. We coordinated over 440 simplex,and he said he had good elevation but had no good way to get over the trees in the area. I then aimed at AD500's position and within 5 minutes, had a link.

AD5OO was using a Linksys WRT54G router in AP mode, and I used NetStumbler to find him. Once the link was made, we were able to transmit, error free (ftp)a 10 MB file. It took a while as it was a windy night and AD500 was using a small MFJ Yogi that was not enclosed in PVC and he said, "it is shaking like a leaf in the wind". I could see the bursts of packets - a pause, then as another bust of packets came in. The 802.11b PHY and FTP beat on the file until it got through without error.
(our longest link with the same equipment, was a brief 16.5 mile link, from south Austin, to far north Austin / Round rock - Martin Hill.)

We went and had a victory dinner and discussed how the 802.11 radios had potential. My station was made from a salvaged antenna, a "Frankenstein" laptop computer running Linux and an Orinoco Silver 802.11 PCMCIA card - all purchased at the Goodwill Computer Works, second hand store in Austin. We were running about 30mw and it worked. Since then, we have better antennas and tripods, and can repeat the 10 mile "sweet spot" link - at will.

We started meeting at the Red Cross ever second Tuesday night of the month to continue our work. We tried a number of links and the basic radios were fine, but we would spend the whole meeting trying to get everyone's computer and radio link set up and the network addressing set up.

So the radios were fine, but configuring this stuff, during an emergency, in the field, was for the birds. So, I mentioned that I had been reading about "mesh" network stuff for years and was sure there was military and commercial equipment that was making good use of the techniques, but was there anybody doing anything

interesting and open sourced, on the Internet?

AD5OO looked and the first thing he came across was some work done by a grad student regarding Optimum Link State Routing (OLSR) for mesh networks. The student needed a cheap platform for development and testing so he used OpenWrt firmware on a WRT54G and published his work and code. There are many details, but AD5OO got the OLSR firmware built and he, NG5V and I loaded it in our 54G routers. It works amazingly well.

You assign static IP addresses to each mesh node. The OLSR code updates all of the 1 and 2 hop links it can see, every 2 seconds. This allows nodes to link, go away and relink without any user intervention. If you have more than one path between two nodes passing data, the OLSR code automatically switches to an alternate route - again with no user intervention. Most of the time you will never notice - with video, you may see a brief pause.

If you power up a mesh node where others are active, it will come up link and be passing traffic in about 30 seconds. If you have a mobile node on, and come into range, they nodes will link in about 5 seconds.

For easy testing we assign some static IP addresses to some IP video cameras on the wired side of each 54G mesh node. The IP camera serves up its compressed JPEG video, on a web page it generates. You can punch in the IP address for the camera on a particular mesh node and it is either there or not. If you get a link you can watch the video on any web browser supporting Java or Direct-X, That is, Internet Explorer or Mozilla etc. At this level the sw does not know or care if you are running Linux, MS-Windows, Mac OS etc.

The long drive back from last years Texas Star Party AD5OO and I spent hours passing live video and FTPing files between vehicles, traveling at 80 mph. It was great fun. We collected data on when FTP would finally give up on a 10 MB transfer as well as a few other metrics. Side by side at 80 MPH the 10 MB file took less than 10 seconds. When we would get a mile or more apart on the I-10 test course, we could loose site of each other over hills and around turns, but the OLSR would relink us as soon as it got enough signal. The 10 MB file once took about 120 seconds before it finished the transfer. Beyond that, I think we were hitting time out limits in the code. (more research to do)

Watching the web browser video, the picture would be moving just fine, then freeze frame when we lost link, and when we relinked, the video restarted, with no user intervention.

Although our initial project is to connect hospital and other high value sites in our area, I hope to move on to store and forward links as well. The hospitals are always located near main roads in the area, and could pass traffic between fixed nodes and mobile

nodes using a technique sometimes called a "data mule" All the
mesh nodes need not be linked all the time to be useful. The mobile
units pass data as bees polinating plants.

AD5OO did some "drive by shootings" to show that a reasonable amount
of data could be transferred from a mobile node to a fixed node at
a drive by speed of 60 mph. He set the fixed link on the side of
a road, on one side of a hill and drove back and forth both ways
to collect data on the link. The antennas were not optimized nor
was their location.

Many area hams commute to work each day on the major roads. With
a store and forward network, they could act as data mules.

I read a lot of academic papers on robots and communications. The
net is great or that. I am a founding member and on the board of
directors for The Robot Group Inc. a 501(c)3 organization in Austin.
I was on one of the teams that entered an autonomous vehicle in the DARPA
Grand Challenge for a robot vehicle to self navigate a 130 mile
course, off road, with no human assistance. Our robot "Marvin"
did not win but we made it to the finals.

I mention this because there are a lot of ideas out there now that
ham radio can make use of, some really slick new stuff. A lot of
the ideas for our Austin HSMM projects come from the stuff I, and
several other members read and share. The ideas are not completely
original, but most have not been applied to ham radio, and they
can be. It takes a group to get these ambitious projects working.
Papers on Disruption (or Delay) Tolerant Networks (DTN) are popular
with the military and others. They are being used for specific
reasons, but ARES has always tried to help when regular communications
is unavailable and it is a natural for ham radio.
"Regular" communications includes computer network and / or Internet
access these days.

Our mesh network can stand on its own with no connection to the
Internet, but with "throw boxes" and other portable packaging,
the mesh nodes can be rapidly deployed to set up and expand the
mesh - and if any one mesh node can get an Internet link, all nodes
will have access within about 5 seconds. We intend to be a
separate network than the ones used by the hospitals, but if
a situation should occur, where normal network links are down,
We can offer the IT guy in the building an CAT-5 cable and tell
him that "I have links to these locations, at these addresses,
at these speeds - do you want to plug it into your network until
regular service is restored?"

We continue our HSMM work here in the Austin area. Most of the
nodes are mobile but the one at the Red Cross has been on the air
for nearly two years. We have one on the roof of one of the hospitals.
Working with the rest of the served agencies is more of a diplomatic
and administrative task than a technical one.

Some ask about security. I came across a posting from LX1TB (in German) showing how to modify the crystal in the WRT54G RF section, to lower the channels more into the ham band. We tried it and in initial testing it works fine. You are no longer 802.11 compliant so 802.11 gear does all it can to ignore you, even if you slide down back into the shared portion of the ISM band. You are between 802.11 channels, and are "invisible" to 802.11 sniffers. The hackers have to find you to mess with you. Do as the matadors do, and side step the issue with a 58 cent crystal change.

Lots more work to do. Lots more questions to clear discuss and answer. We need microwave, software and networking experts to help.

This stuff is quite interesting and if I can set up a station from parts from the second hand store and side step most hackers with a 58 cent crystal change, the spirit of ham radio is alive and well, there is just new stuff to work with.

I gave the first presentation on our work in April 2007 to the Austin Amateur Radio Club. The HSMM group grew switly after that. I did a second presentation to the Armadillo Repeater organization, and one to the Williamson County Amateur Radio club. With these three presentations we have had a lot of help and offers site locations - more than we can deal with in our spare time.

We are proceeding as resources allow. I have not given any more presentations lately as I have gigabytes of site surveys, topo cross sections, NetStumbler and Kismet survey data to process and work on some new hw and sw. We are on version 2 of our mesh-node fw. The WRT54GL is about 98% of what we need for basic mesh node units. but we are experimenting with a variety of router development boards, and portable servers with no moving parts.

The work you guys have done with the balloon race is impressive and it is most helpful that you have posted the information.

Glenn,

Do you have some photos you could send me? Direct is OK.

k8ocl@...

I would like to use some this excellent material in the next CQ-VHF
HSMM column along with some previous material from this reflector.

Thanks,
John, K8OCL

So, I mentioned thatI had been reading about "mesh" network stuff for years and wassure there was military and commercial equipment that was makinggood use of the techniques, but was there anybody doing anythinginteresting and open sourced, on the Internet?AD5OO looked and the first thing he came across was some workdone by a grad student regarding Optimum Link State Routing (OLSR)for mesh networks. The student needed a cheap platform for development andtesting so he used OpenWrt firmware on a WRT54G and published hiswork and code. There are manydetails, but AD5OO got the OLSR firmware built and he, NG5V andI loaded it in our 54G routers. It works amazingly well.You assign static IP addresses to each mesh node. The OLSR codeupdates all of the 1 and 2 hop links it can see, every 2 seconds.This allows nodes to link, go away and relink without any userintervention. If you have more than one path between two nodespassing data, the OLSR code automatically switches to an alternateroute - again with no user intervention. Most of the time you willnever notice - with video, you may see a brief pause.If you power up a mesh node where others are active, it will comeup link and be passing traffic in about 30 seconds. If you have amobile node on, and come into range, they nodes will link in about 5 seconds.For easy testing we assign some static IP addresses to some IP videocameras on the wired side of each 54G mesh node. The IP cameraserves up its compressed JPEG video, on a web page it generates.You can punch in the IP address for the camera on a particular mesh node and it is either there or not. If you get a link youcan watch the video on any web browser supporting Java or Direct-X,That is, Internet Explorer or Mozilla etc. At this level the swdoes not know or care if you are running Linux, MS-Windows, Mac OSetc.The long drive back from last years Texas Star Party AD5OO and Ispent hours passing live video and FTPing files between vehicles,traveling at 80 mph. It was great fun. We collected data on whenFTP would finally give up on a 10 MB transfer as well as a few othermetrics. Side by side at 80 MPH the 10 MB file took less than10 seconds. When we would get a mile or more apart on the I-10test course, we could loose site of each other over hills and around turns, but the OLSR would relink us as soon as it gotenough signal. The 10 MB file once took about 120 seconds beforeit finished the transfer. Beyond that, I think we were hittingtime out limits in the code. (more research to do)Watching the web browser video, the picture would be moving justfine, then freeze

frame when we lost link, and when we relinked,the video restarted, with no user intervention.Although our initial project is to connect hospital and other highvalue sites in our area, I hope to move on to store and forwardlinks as well. The hospitals are always located near main roadsin the area, and could pass traffic between fixed nodes and mobilenodes using a technique sometimes called a "data mule" All themesh nodes need not be linked all the time to be useful. The mobileunits pass data as bees polinating plants.AD5OO did some "drive by shootings" to show that a reasonable amountof data could be transferred from a mobile node to a fixed node ata drive by speed of 60 mph. He set the fixed link on the side ofa road, on one side of a hill and drove back and forth both waysto collect data on the link. The antennas were not optimized norwas their location. Many area hams commute to work each day on the major roads. Witha store and forward network, they could act as data mules.I read a lot of academic papers on robots and communications. Thenet is great or that. I am a founding member and on the board ofdirectors for The Robot Group Inc. a 501(c)3 organization in Austin.I was on one of the teams that entered an autonomous vehicle in the DARPAGrand Challenge for a robot vehicle to self navigate a 130 milecourse, off road, with no human assistance. Our robot "Marvin"did not win but we made it to the finals.I mention this because there are a lot of ideas out there now thatham radio can make use of, some really slick new stuff. A lot of the ideas for our Austin HSMM projects come from the stuff I, andseveral other members read and share. The ideas are not completelyoriginal, but most have not been applied to ham radio, and theycan be. It takes a group to get these ambitious projects working.Papers on Disruption (or Delay) Tolerant Networks (DTN) are popularwith the military and others. They are being used for specificreasons, but ARES has always tried to help when regular communicationsis unavailable and it is a natural for ham radio."Regular" communications includes computer network and / or Internetaccess these days.Our mesh network can stand on its own with no connection to theInternet, but with "throw boxes" and other portable packaging,the mesh nodes can be rapidly deployed to set up and expand themesh - and if any one mesh node can get an Internet link, all nodeswill have access within about 5 seconds. We intend to be a separate network than the ones used by the hospitals, but ifa situation should occur, where normal network links are down,We can offer the IT guy in the building an CAT-5 cable and tellhim that "I have links to these locations, at these addresses,at these speeds - do you want to plug it into your network untilregular service is restored?"We continue our HSMM work here in the Austin area. Most of the nodes are mobile but the one at the Red Cross has been on the airfor nearly two years. We have one on the roof of one of the hospitals.Working with the rest of the served agencies is more of a diplomaticand administrative task than a technical one.Some ask about security. I came across a posting from LX1TB(in German) showing how to modify the crystal in the WRT54G RFsection, to lower the channels more into the ham band. We triedit and in initial testing it works fine. You are no longer 802.11compliant so 802.11 gear does all it can to ignore you, even if youslide down back into the shared portion of the ISM band. Youare between 802.11 channels, and are "invisible" to 802.11 sniffers.The hackers have to find you to mess with you. Do as the matadorsdo, and side step the issue with a 58 cent crystal change.Lots more work to do. Lots more questions to clear discuss andanswer. We need microwave, software and networking experts to help.This stuff is quite interesting and if I can set up a station fromparts from the second hand store and side step most hackers witha 58 cent crystal change, the spirit of ham radio is alive and well,there is just new stuff to work with.I gave the first presentation on our work in April 2007 to the Austin AmateurRadio Club. The HSMM group grew switly after that. I did a second presentationto the Armadillo Repeater organization, and one to the Williamson CountyAmateur Radio club. With these three presentations we have had a lot of helpand offers site locations - more than we can deal with in our spare time.We are proceeding as resources allow. I have not given any more presentationslately as I have

gigabytes of site surveys, topo cross sections, NetStumbler andKismet survey data to process and work on some new hw and sw. We are onversion 2 of our mesh-node fw. The WRT54GL is about 98% of what we needfor basic mesh node units. but we are experimenting with a variety of routerdevelopment boards, and portable servers with no moving parts.The work you guys have done with the balloon race is impressive and it ismost helpful that you have posted the information.73'sKD5MFW--- In ntms-hsmm@yahoogroups.com, Kilgore <kilgore1317@...> wrote:>> Glenn -> > I'm posting this message to the Yahoo group. 1230. Re: [ntms-hsmm] 08 Wild Ride Test

Yahoo group: DAWG-HSMM
Date: 2008-05-02 21:07:45 UTC
From: Kipton Moravec
Topic: 1224 Message: 1230

I wanted to let you folks know last weekend we did a trial run of the Wild Ride 08, HSMM setup.

John N5OOM and I drove down some back roads around Lake Lavon, and came upon a 70' ham tower on a hill overlooking the lake. The gate had the last name ☐Kellow, and it turned out to be a member of the Richardson Club. We found it was Bob, W5LT.

He let us come over last Saturday, and mount one of our units on his tower. He has the coolest tilt over tower. He lowered it, we clamped our unit on to his big boom antenna, and taped the CAT5 cable down the tower.☐ Then he raised the tower, and we were on the air.

☐I placed one of our routers inside the house, to isolate our network from his house network. And hooked up to his high speed Internet connection. We run 12V PoE over the unused Ethernet wires so we do not have to run separate power lines.

We were able to connect immediately with our laptops, and get the Google web page, but had difficulties with the other routers. After many reboots and configuration changes we finally turned off WEP security and was able to connect to the other routers.

By this time it was dark, but we wanted to see if it would work. I had a 24 db antenna in a tripod in the back of my truck, and John had a 8 db omnidirectional antenna on his SUV rack. Both were setup with Horizontal polarity, like the antenna on the tower.

We had no problems at the Lavon Dam, 4.5 miles both my 24 db directional antenna
and John's 8 db omni-directional got it.

Since we were in the area, we decided to go to Nevada this would be a 9.7 mile hop. We did not have high expectations because we could not get to the area that had clear line-of-sight by car, and we were not going to run around a school yard
at night in the dark.

We got as close as we could, but there was a tree line in between W5LT and the Nevada school parking lot. The 8 db omni could not connect. But after adjusting the 24 db pointing direction, we could see it, then we could ping it, and finally we were able to log into the router on top of W5LT's tower!

There was joy in Nevada.

We still have to figure out why we could not connect with WEP turned on. But we were able to make the links. 9.7 miles is the longest distance I have been able to reach.

Bingo! That's exactly why I like this stuff. Incidentally, KM5I just
signed up to present Winlink Telpac and APRS - Simultaneous operation
from one "box" at Ham-Com, so you might be interested in that.

I would definitely be interested in your presentation. It is unlikely that I will be able to attend Ham-Com.

I am glad to see some promotion of these ideas. It takes a long time to get this stuff done in your spare time. One of the early steps is to get folks to understand that these things can and should be linked.

When not being used for an event, some of the area ARCHES stations forward APRS data. One of the stations in central Austin, has done a world of good for the coverage in Austin. Before this, we only had reasonable coverage in extreme north and south Austin.

John,

As soon as I got your message, I sent out email to members of the group that have photos. I was messing with the equipment and not behind the camera much. The only shots I have were taken with my cell phone camera which is probably way too low res for publication.

I will get back with you when I get some replies.

What type of photos would you be interested in?
Antennas, portable nodes, people on towers mounting antennas, mobile operation? I still have real low res video of our first USB video camera working at Field Day in 2003 - it is REALLY low res as the camera was from the Goodwill second had computer store here in Austin, and it was old for it's time even then.

I will do what I can to round up some photos.

There are a lot of details I had to gloss over in the summary I posted. As I put together the first presentation I did for the AARC April of last year, I realized the subject of every slide could be the basis for a presentation of its own. If you have any questions about the material I posted, let me know. I would not like to overstate or understate the efforts of the group.

I have not rounded up the estimated figures for last year, but in 2006 I came across sales figures of > 2 million WiFi devices sold - most, if not all of which, could be used as ham radios. It is just too easy and cheap not to experiment with!

I will let you know what I find out about the photos.
I will need to get then permission of the photographer and those in the photos, for smooth sailing.

-Glenn

Glenn,

Do you have some photos you could send me? Direct is OK.

k8ocl@...

I would like to use some this excellent material in the next CQ-VHF HSMM column along with some previous material from this reflector.

Thanks,
John, K8OCL

To: ntms-hsmm@yahoogroups.com; kd5mfw_7@...: kd5mfw_7@...: Fri, 2 May 2008 09:11:23 -0700Subject: [ntms-hsmm] HSMM in the Austin TX area

Greetings from Glenn Currie, KD5MFWThe ARCHES system:<http://www.your-website-in-24-hours.com/travishams/tcares.org/index.php?option=com_content&task=blogcategory&id=14&Itemid=26>Has been working well. We originally installed stations at all 9 of the major hospitals in the Austin area(at this time the area is growing quickly andmore hospitals and clinics are popping up all around here).We have done a number of Simulated Emergency Tests with the City of Austin and Travis County EOC. The system worked very well. Wewere later contacted by a group of central Texas clinics who wantedto set up a similar system and tie into our ARCHES system.The City of Austin and Travis County EOC is resource central forour area. If you can get them information on an emergency, theyare in a position to deploy resources. By the time we get all theclinics in surrounding towns linked in, we will have something like40 stations or more. With a 9 Austin area hospital SET, we soakedthe available packet channels.My suggestion, back in 2003 was to move some of the local trafficoff of 2m / 440 and open up some fat pipes with microwave links - between locations where it was feasible. In a dense urban arealike Austin, if you have good locations you can use HSMM to handlea lot of the local traffic, and leave the 2m / 440 frequencies forthe folks in Taylor, Llano, San Marcos, Luling etc. to come in on.The links are slower, but the 2m / 440 propagation works like a champ for them - if they are not completely jammed with local Austin traffic.I continue to promote the idea and have someexcellent help here in the Austin area. We also have a couple of Winlink 2000 related stations in the area,one in Williamson County, just north of Austin, and one at the niceham station they built for us at CTECC where the City of Austinand Travis County have their EOC. We also have the State of TexasEOC in town, and some of our group members help staff the ham stationthere. The NVIS links works
well for a lot of situations that other modes do not. As far as the consumer 802l.11 gear goes...First we tried the 802.11b radios to see if they would be worthmessing with. NG5V and I did some testing at the Canyon of the Eagles Observatory. We did a 1 mile link with little trouble - 30mw, WAP-11,24dB dish on one end and 14db panel on the other end, connected toa laptop PCMCIA card.Some time later NG5V, AD5OO, and I met in a shopping mall parkinglot in Austin, pulled up a topo map on a laptop and picked somelikely high points in the area to try links.We deployed and within an hour we had each set up our stations.I picked the parking garage of one of our ARCHES supported hospitalsin south Austin. NG5V set up in NE Austin but was blocked byground clutter (Trees). I suggested AD5OO try from a particular parkinggarage I was familiar in north Austin. "You really want to go forthe gusto! he said, that's 10 miles across downtown Austin". Thepath crossed over the super heavily
802.11 rich west campus area ofThe University of Texas.Using the computer topo map I tried pointing my 24dB BBQ grill dish(salvaged) at NG5V. We coordinated over 440 simplex,and he saidhe had good elevation but had no good way to get over the trees inthe area. I then aimed at AD500's position and within 5 minutes, hada link.AD5OO was using a Linksys WRT54G router in AP mode, and I usedNetStumbler to find him. Once the link was made, we were ableto transmit, error free (ftp)a 10 MB file. It took a while as itwas a windy night and AD500 was using a small MFJ Yogi that wasnot enclosed in PVC and he said, "it is shaking like a leaf inthe wind". I could see the bursts of packets - a pause, thenas another bust of packets came in. The 802.11b PHY and FTP beat on the file until it got through without error.(our longest link with the same equipment, was a brief 16.5 mile link, fromsouth Austin, to far north Austin / Round rock - Martin Hill.)We went and had a victory dinner and

discussed how the 802.11radios had potential. My station was made from a salvaged antenna,a "Frankenstein" laptop computer running Linux and an Orinoco Silver802.11 PCMCIA card - all purchased at the Goodwill Computer Works,second hand store in Austin. We were running about 30mw and itworked. Since then, we have better antennas and tripods, and canrepeat the 10 mile "sweet spot" link - at will. We started meeting at the Red Cross ever second Tuesday night ofthe month to continue our work. We tried a number of links andthe basic radios were fine, but we would spend the whole meetingtrying to get everyone's computer and radio link set up and the network addressing set up.So the radios were fine, but configuring this stuff, during anemergency, in the field, was for the birds. So, I mentioned thatI had been reading about "mesh" network stuff for years and wassure there was military and commercial equipment that was makinggood use of the techniques, but was there anybody doing anythinginteresting and open sourced, on the Internet?AD5OO looked and the first thing he came across was some workdone by a grad student regarding Optimum Link State Routing (OLSR)for mesh networks. From: John Champa
Topic: 1228 Message: 1234

Glenn,

The type of photos that work well are close-in shots of people and gear, especially any antenna (describe / name the antenna, if needed).

Always try to include people, if only for scale. A hand pointing or adjusting something. And, always ID the folks completely with full name and call sign... even if it is only their hand, or the back of their head (HI).

Cell phone shots are OK, as long as identified as such. Folks understand.

Please give photo credit when ever possible e.g. (Photo by Glenn, KD5MFW) or what ever you like folks to call you.

Many thanks. This should make a fun HSMM article!

BTW, I keep all the HSMM stuff folks send to me. Even if I can't get it all into an article, it may show up later in the Second Edition of the ARRL VHF DigitalHandbook in 2010, etc. (HI)

73,
John, K8OCL

Subject: RE: [ntms-hsmm] HSMM in the Austin TX area

John,

As soon as I got your message, I sent out email to members of

the group that have photos. I was messing with the equipment

and not behind the camera much. The only shots I have were

taken with my cell phone camera which is probably way too low

res for publication.

I will get back with you when I get some replies.

What type of photos would you be interested in?

Antennas, portable nodes, people on towers mounting

antennas, mobile operation? I still have real low res

video of our first USB video camera working at Field Day in

2003 - it is REALLY low res as the camera was from the Goodwill

second had computer store here in Austin, and it was old for

it's time even then.

I will do what I can to round up some photos.

There are a lot of details I had to gloss over in the summary

I posted. As I put together the first presentation I did for the

AARC April of last year, I realized the subject of every slide could

be the basis for a presentation of its own. If you have any questions

about the material I posted, let me know. I would not like to overstate

or understate the efforts of the group.

I have not rounded up the estimated figures for last year, but in 2006

I came across sales figures of > 2 million WiFi devices sold - most, if not

all of which, could be used as ham radios. It is just too easy and cheap

not to experiment with!

I will let you know what I find out about the photos.

I will need to get then permission of the photographer and

those in the photos, for smooth sailing.

-Glenn

John Champa <k8ocl@...> wrote:

Glenn,

Do you have some photos you could send me? Direct is OK.

k8ocl@...

I would like to use some this excellent material in the next CQ-VHF

HSMM column along with some previous material from this reflector.

Thanks,

John, K8OCL

To: ntms-hsmm@yahoogroups.com; kd5mfw_7@...: kd5mfw_7@...: Fri, 2 May 2008 09:11:23 -0700Subject: [ntms-hsmm] HSMM in the Austin TX area

Greetings from Glenn Currie, KD5MFWThe ARCHES system:<http://www.your-website-in-24-hours.com/travishams/tcares.org/index.php?option=com_content&task=blogcategory&id=14&Itemid=26>Has been working well. We originally installed stations at all 9 of the major hospitals in

the Austin area(at this time the area is growing quickly andmore hospitals and clinics are popping up all around here).We have done a number of Simulated Emergency Tests with the City of Austin and Travis County EOC. The system worked very well. Wewere later contacted by a group of central Texas clinics who wantedto set up a similar system and tie into our ARCHES system.The City of Austin and Travis County EOC is resource central forour area. If you can get them information on an emergency, theyare in a position to deploy resources. By the time we get all theclinics in surrounding towns linked in, we will have something like40 stations or more. With a 9 Austin area hospital SET, we soakedthe available packet

channels.My suggestion, back in 2003 was to move some of the local trafficoff of 2m / 440 and open up some fat pipes with microwave links - between locations where it was feasible. In a dense urban arealike Austin, if you have good locations you can use HSMM to handlea lot of the local traffic, and leave the 2m / 440 frequencies forthe folks in Taylor, Llano, San Marcos, Luling etc. to come in on.The links are slower, but the 2m / 440 propagation works like a champ for them - if they are not completely jammed with local Austin traffic.I continue to promote the idea and have someexcellent help here in the Austin area. We also have a couple of Winlink 2000 related stations in the area,one in Williamson County, just north of Austin, and one at the niceham station they built for us at CTECC where the City of Austinand Travis County have their EOC. We also have the State of TexasEOC in town, and some of our group members help staff the ham stationthere. The NVIS links works

well for a lot of situations that other modes do not. As far as the consumer 802l.11 gear goes...First we tried the 802.11b radios to see if they would be worthmessing with. NG5V and I did some testing at the Canyon of the Eagles Observatory. We did a 1 mile link with little trouble - 30mw, WAP-11,24dB dish on one end and 14db panel on the other end, connected toa laptop PCMCIA card.Some time later NG5V, AD5OO, and I met in a shopping mall parkinglot in Austin, pulled up a topo map on a laptop and picked somelikely high points in the area to try links.We deployed and within an hour we had each set up our stations.I picked the parking garage of one of our ARCHES supported hospitalsin south Austin. NG5V set up in NE Austin but was blocked byground clutter (Trees). I suggested AD5OO try from a particular parkinggarage I was familiar in north Austin. "You really want to go forthe gusto! he said, that's 10 miles across downtown Austin". Thepath crossed over the super heavily

802.11 rich west campus area ofThe University of Texas.Using the computer topo map I tried pointing my 24dB BBQ grill dish(salvaged) at NG5V. We coordinated over 440 simplex,and he saidhe had good elevation but had no good way to get over the trees inthe area. I then aimed at AD500's position and within 5 minutes, hada link.AD5OO was using a Linksys WRT54G router in AP mode, and I usedNetStumbler to find him. Once the link was made, we were ableto transmit, error free (ftp)a 10 MB file. It took a while as itwas a windy night and AD500 was using a small MFJ Yogi that wasnot enclosed in PVC and he said, "it is shaking like a leaf inthe wind". I could see the bursts of packets - a pause, thenas another bust of packets came in. The 802.11b PHY and FTP beat on the file until it got through without error.(our longest link with the same equipment, was a brief 16.5 mile link, fromsouth Austin, to far north Austin / Round rock - Martin Hill.)We went and had a victory dinner and

discussed how the 802.11radios had potential. My station was made from a salvaged antenna,a "Frankenstein" laptop computer running Linux and an Orinoco Silver802.11 PCMCIA card - all purchased at the Goodwill Computer Works,second hand store in Austin. We were running about 30mw and itworked. Since then, we have better antennas and tripods, and canrepeat the 10 mile "sweet spot" link - at will. We started meeting at the Red Cross ever second Tuesday

night ofthe month to continue our work. We tried a number of links andthe basic radios were fine, but we would spend the whole meetingtrying to get everyone's computer and radio link set up and the network addressing set up.So the radios were fine, but configuring this stuff, during anemergency, in the field, was for the birds. So, I mentioned thatI had been reading about "mesh" network stuff for years and wassure there was military and commercial equipment that was makinggood use of the techniques, but was there anybody doing

anythinginteresting and open sourced, on the Internet?AD5OO looked and the first thing he came across was some workdone by a grad student regarding Optimum Link State Routing (OLSR)for mesh networks. The student needed a cheap platform for development andtesting so he used OpenWrt firmware on a WRT54G and published hiswork and code. There are manydetails, but AD5OO got the OLSR firmware built and he, NG5V andI loaded it in our 54G routers. It works amazingly well.You assign static IP addresses to each mesh node. The OLSR codeupdates all of the 1 and 2 hop links it can see, every 2 seconds.This allows nodes to link, go away and relink without any userintervention. If you have more than one path between two nodespassing data, the OLSR code automatically switches to an alternateroute - again with no user intervention. Most of the time you willnever notice - with video, you may see a brief pause.If you power up a mesh node where others are active, it will comeup link and be

passing traffic in about 30 seconds. If you have amobile node on, and come into range, they nodes will link in about 5 seconds.For easy testing we assign some static IP addresses to some IP videocameras on the wired side of each 54G mesh node. The IP cameraserves up its compressed JPEG video, on a web page it generates.You can punch in the IP address for the camera on a particular mesh node and it is either there or not. If you get a link youcan watch the video on any web browser supporting Java or Direct-X,That is, Internet Explorer or Mozilla etc. At this level the swdoes not know or care if you are running Linux, MS-Windows, Mac OSetc.The long drive back from last years Texas Star Party AD5OO and Ispent hours passing live video and FTPing files between vehicles,traveling at 80 mph. It was great fun. We collected data on whenFTP would finally give up on a 10 MB transfer as well as a few othermetrics. Side by side at 80 MPH the 10 MB file took less than10 seconds. When we

would get a mile or more apart on the I-10test course, we could loose site of each other over hills and around turns, but the OLSR would relink us as soon as it gotenough signal. The 10 MB file once took about 120 seconds beforeit finished the transfer. Beyond that, I think we were hittingtime out limits in the code. (more research to do)Watching the web browser video, the picture would be moving justfine, then freeze frame when we lost link, and when we relinked,the video restarted, with no user intervention.Although our initial project is to connect hospital and other highvalue sites in our area, I hope to move on to store and forwardlinks as well. The hospitals are always located near main roadsin the area, and could pass traffic between fixed nodes and mobilenodes using a technique sometimes called a "data mule" All themesh nodes need not be linked all the time to be useful. The mobileunits pass data as bees polinating plants.AD5OO did some "drive by shootings" to show

that a reasonable amountof data could be transferred from a mobile node to a fixed node ata drive by speed of 60 mph. He set the fixed link on the side ofa road, on one side of a hill and drove back and forth both waysto collect data on the link. The antennas were not optimized norwas their location. Many area hams commute to work each day on the major roads. Witha store and forward network, they could act as data mules.I read a lot of academic papers on robots and communications. Thenet is great or that. I am a founding member and on the board ofdirectors for The Robot Group Inc. a 501(c)3 organization in

Austin.I was on one of the teams that entered an autonomous vehicle in the DARPAGrand Challenge for a robot vehicle to self navigate a 130 milecourse, off road, with no human assistance. Our robot "Marvin"did not win but we made it to the finals.I mention this because there are a lot of ideas out there now thatham radio can make use of, some really slick new stuff. A lot

of the ideas for our Austin HSMM projects come from the stuff I, andseveral other members read and share. The ideas are not completelyoriginal, but most have not been applied to ham radio, and theycan be. It takes a group to get these ambitious projects working.Papers on Disruption (or Delay) Tolerant Networks (DTN) are popularwith the military and others. They are being used for specificreasons, but ARES has always tried to help when regular communicationsis unavailable and it is a natural for ham radio."Regular" communications includes computer network and / or Internetaccess these days.Our mesh network can stand on its own with no connection to theInternet, but with "throw boxes" and other portable packaging,the mesh nodes can be rapidly deployed to set up and expand themesh - and if any one mesh node can get an Internet link, all nodeswill have access within about 5 seconds. We intend to be a separate network than the ones used by the hospitals, but ifa situation

should occur, where normal network links are down,We can offer the IT guy in the building an CAT-5 cable and tellhim that "I have links to these locations, at these addresses,at these speeds - do you want to plug it into your network untilregular service is restored?"We continue our HSMM work here in the Austin area. Most of the nodes are mobile but the one at the Red Cross has been on the airfor nearly two years. We have one on the roof of one of the hospitals.Working with the rest of the served agencies is more of a diplomaticand administrative task than a technical one.Some ask about security. I came across a posting from LX1TB(in German) showing how to modify the crystal in the WRT54G RFsection, to lower the channels more into the ham band. We triedit and in initial testing it works fine. You are no longer 802.11compliant so 802.11 gear does all it can to ignore you, even if youslide down back into the shared portion of the ISM band. Youare between 802.11 channels, and

are "invisible" to 802.11 sniffers.The hackers have to find you to mess with you. Do as the matadorsdo, and side step the issue with a 58 cent crystal change.Lots more work to do. Lots more questions to clear discuss andanswer. We need microwave, software and networking experts to help.This stuff is quite interesting and if I can set up a station fromparts from the second hand store and side step most hackers witha 58 cent crystal change, the spirit of ham radio is alive and well,there is just new stuff to work with.I gave the first presentation on our work in April 2007 to the Austin AmateurRadio Club. The HSMM group grew switly after that. I did a second presentationto the Armadillo Repeater organization, and one to the Williamson CountyAmateur Radio club. With these three presentations we have had a lot of helpand offers site locations - more than we can deal with in our spare time.We are proceeding as resources allow. I have not given any more presentationslately as I

have gigabytes of site surveys, topo cross sections, NetStumbler andKismet survey data to process and work on some new hw and sw. We are onversion 2 of our mesh-node fw. The WRT54GL is about 98% of what we needfor basic mesh node units. but we are experimenting with a variety of routerdevelopment boards, and portable servers with no moving parts.The work you guys have done with the balloon race is impressive and it ismost helpful that you have posted the information.73'sKD5MFW--- In ntms-hsmm@yahoogroups.com, Kilgore <kilgore1317@...> wrote:>> Glenn -> > I'm posting this message to the Yahoo group. Hi Doug. I'm being told that there are two serial ports on the WRT54GL and GS version. Below are some links that explain how to get to them.

I would like to receive APRS packets from a TNC over RS232 and then have a linux script forward that data to the APRS gateway servers.

I would also like to do the same thing with Ships at sea. There is a system very similar to APRS for ships called AIS where ships broadcast their GPS location over VHF Marine channel 88 with 9600 baud data. There is more info at the shipplotter link below.

1240. DD-WRT

Yahoo group: DAWG-HSMM
Date: 2008-05-06 02:58:32 UTC
From: Jerry Karlovich, KD5OM
Topic: 1240 Message: 1240

Okie Dokie Smokies,

I flashed my WRT54Gv2 with the DD-WRT firmware and seems to be a successful upgrade.

I want to use it in a flat panel antenna, ethernet down to another WRT54G that will "repeat" to my laptop nearby. All this at the RV Park with free wifi but I don't have to be in the park store's parking lot to be able to aquire wifi. The flat panel antenna will be on a 20' pole facing the source (park store). I want to continue to be wireless with my laptop. Reason for the second WRT54G.

I have my SSID and WEP set on the DD-WRT and was able to connect to it on a different computer's wifi card. That's about how far I went in the configuration. I can quickly mess things up from what it looks like to me. I need a little help with what to do next.

Any givers?

1243. WRT54G - Which antenna port?

Yahoo group: DAWG-HSMM
Date: 2008-05-13 03:32:09 UTC
From: Jerry Karlovich, KD5OM
Topic: 1243 Message: 1243

I'm installing my WRT54G into a flat panel antenna. As ya'll well know, the WRT has two antenna connections and the flat panel has one.

After examining the WRT PC board, both antennas connect to the same trace through U16. Obviously some sort of switching doodad.

Is it important which antenna connection I wire my flat panel to?

JK

DD-WRT on WRT54GL has a place to select ant 1 or ant 2 or both. I've left both active in my Rootenna installation. One connected to high gain antenna and the other connected to a folded over antenna that came with unit.

Not sure about the WRT54G unit.

It does not matter which one you choose. Pick one and set the parameter in DD-WRT to use that antenna.

In normal operation, it uses the antenna with the strongest signal. At 2.4 GHz a move of a few inches can make a big difference in the signal. When you use a gain antenna, you want it to always use the gain antenna, so select the side the gain antenna is on with the DD-WRT software.

Thanks guys,

I found buried in the DD-WRT menus the antenna selection. I guess it pays to look around.

Antenna 1 has a convenient pad to solder to so I suppose I'll use that one.

I think I'd opt for getting an RP-TNC pigtail and not solder on the board.
One source: http://www.fab-corp.com/home.php?cat=286 ask for ham

Also check at Tanner's. They've been carrying RP connectors for a
while now. I just can't remember if they had pig-tails to go with
them or not... and I wuz just in there Friday afternoon. :-\

I have used the pigtails from FAB Corp. They are excellent quality.
And they hold up very well with repeated use.

Also, I got a 10% Amateur Radio discount.

1250. 08 Richardson WildRide! report

Yahoo group: DAWG-HSMM
Date: 2008-05-21 15:17:30 UTC
From: J. Beadles
Topic: 1250 Message: 1250

Photos from the 08 WildRide! HSMM task are on line at:

http://www.k5rwk.org/wr/

HSMM SYSTEMS

START-STOP

Start-Stop used three Wifi hops. Internet access was provided by the City of Richardson. There is no direct line of site to the net control location, so access was transmitted via wifi bridge to a repeater in the field next to start stop. The repeater was then connected to the net control location and to a computer hooked up to a wide screen TV which showed a live slide show of photos taken by the rest stop operators.

This system was configured by John N5OOM, Kip KE5NGX and Kevin KD5YVL. This system has been used for the past 3 years, and has proven to be very reliable.

REST STOP 1

There was no line of site to this location, so Doug KD5OUG arranged with a local realtor office to borrow access to their local wifi system.

REST STOP 2

In advance of the event, a drive survey was performed of potential high spots in the Lake Lavon area. It was found that Bob W5LT lives on the west side of the lake, and owns a 70ft tilt-over tower. Path profiles in Radio Mobile showed clear line of site to Rest Stops 2 and 3. A WRT54G in a 19dB rootenna was installed on Bob's tower. Testing showed that both paths worked.

This system used a single wifi hop 6.05 miles long. A 19 dB antenna was used at the feed end, and a 14 dB antenna at the rest stop. This system was configured by Kip KE5NGX and John N5OOM.

REST STOP 3

There is no direct line of site from W5LT's house to the actual rest stop, because the rest stop is blocked by a school at the rest stop end of the path. So, an 11.38 mile path was set up between W5LT and the school, and a second thousand foot hop brought internet to the rest stop. The two repeater stations at the school were connected via a 300 ft run of CAT-5 cable. This system was configured by Kip KE5NGX and John N5OOM.

REST STOP 4

There was no direct line of site to any particular internet feed, so Doug KD5OUG arranged with a local homeowner to borrow access to their existing wifi access point.

Notes: In past years, local hams have adopted a mast system consisting of a 16' push up flag pole from Harbor Freight. This often appears in local stores for about $35. (They have a 20' flag pole online). Conveniently, the flag pole perfectly fits a plastic roll over base from the online store Sportsmans Guide which sells for $24.

This year I made efforts to make the system install as tool free as possible. I installed several WRT54G radios in 14dB rootenna packages and fit them with RAM 1.5" ball mounts. A ram mount strap rail base (MFG P/N: RAM-108BU) goes on the mast, with a thumb-screw strap clamp holding the mount in place. The mast clamp on the rootenna was replaced with a ball on a 2.5 inch plate (MFG P/N: RAM-202U), with holes drilled to match the studs on the antenna. A plastic 2.25" arm (MFG P/N: RAP-201U-B) clamps the antenna to the mast. This system is a bit pricey, but really speeds assembly. Pictures of this system are on the above mentioned page, under the "Asst. Comm. Director" page.

Free Webinar: Introduction to ZigBee Mesh Networking
- Sponsored by Digi International -
Title: Introduction to ZigBee Mesh Networking
Date: Wednesday, May 28, 2008Time: 2:00 pm Central Daylight Time (GMT -05:00, Chicago)
Register to Attend
Webinar Summary: What are 802.15.4 and ZigBee? and how do they compare to other wireless technologies? When would I want to use a simple 802.15.4 network versus deploying a self-forming, self-healing ZigBee mesh network? What does a coordinator do and what happens if it fails? With the release of the ZigBee 2007 standard, can we expect real interoperability? All of these questions will be answered in this introduction to 802.15.4 and ZigBee technologies webinar.Presented by Jordan Husney, Lead Engineer, Digi International
Key TakeawaysAn introduction to 802.15.4 point-to-multipoint and ZigBee mesh network formation, addressing, transmission styles and node types. Technical detail will be given on the node joining process, network address discovery, and ZigBee mesh network self-healing. Some time will also be spent contrasting the ZigBee 2006 and ZigBee 2007 feature sets. Key Product Focus
XBee? modules, XBee adapters, ConnectPort? X Gateways
Intended AudienceThose seeking a basic to intermediate understanding of ZigBee technologies in technical detail.

I've been researching ZigBee as part of a work project, and it is primarily a "home area network", slower than WiFi, longer range than Bluetooth, and apparently targeted at the home automation/integration market, and as such is much simpler and cheaper to integrate into microcontroller based systems than either WiFi or Bluetooth.

Possible amateur radio uses include short hop digital audio/command links, wireless replacement of rig control cables, and integration of sensing devices such as GPS or weather station components into an overall ZigBee connected system, providing the sensor data seamlessly to multiple data consumers such as APRS, mapping software, and so on. This would be beneficial from the point of view that the more common "nest of snakes" (USB and Serial cables) could be replaced by a common wireless backbone, and that the data which currently is available typically to only a single consumer application could be distributed among multiple applications without special programming, and without built in cooperation between the applications wishing to consume the data.

Most ZigBee radios implement a serial interface and AT style command set which allows full access to the features of ZigBee without complicated hardware interfacing, a feature which makes ZigBee particularly suitable for microcontroller based applications as most modern microcontrollers have one or more on-chip serial UARTs. If the chip in question has only a single UART and another is needed to talk to an external device such as a rig, GPS, or weather device, a "software" UART can be easily created from numerous example implementations available on the web.

What kinds of applications were y'all considering when you mentioned ZigBee ??

John,

You are right on target! What I had in mind was the first item you mentioned:

"Possible amateur radio uses include short hop digital audio/command links..."

Specifically, with a BDA, longer range / smaller bandwidth 2.4 GHz links.

Are you going to the Plano Hamcom in June? Perhaps you would like to co-
present a joint paper on this subject?

73,
John, K8OCL

Work permitting - it is something of a crash project and we have about 6-8 more weeks of deep work to complete. That said, I should have several ZigBee modules available later this week or early next week to play with. They are not on standard 0.1 centers, so I'll have to make an adapter board to hook them up to my development system. I'm working primarily with ATMega MCUs, but I will have a full PIC development and debugging setup available later this week. (The project is using both processors in various roles)

Contact me off list and lets figure out what we want to accomplish.

I've been researching ZigBee as part of a work project, and it is primarilya "home area network", slower than WiFi, longer range than Bluetooth, andapparently targeted at the home automation/integration market, and as suchis much simpler and cheaper to integrate into microcontroller based systemsthan either WiFi or Bluetooth.Possible amateur radio uses include short hop digital audio/command links,wireless replacement of rig control cables, and integration of sensingdevices such as GPS or weather station components into an overall ZigBeeconnected system, providing the sensor data seamlessly to multiple dataconsumers such as APRS, mapping software, and so

on. This would bebeneficial from the point of view that the more common "nest of snakes" (USBand Serial cables) could be replaced by a common wireless backbone, and thatthe data which currently is available typically to only a single consumerapplication could be distributed among multiple applications without specialprogramming, and without built in cooperation between the applicationswishing to consume the data.Most ZigBee radios implement a serial interface and AT style command setwhich allows full access to the features of ZigBee without complicatedhardware interfacing, a feature which makes ZigBee particularly suitable formicrocontroller based applications as most modern microcontrollers have oneor more on-chip serial UARTs. If the chip in question has only a single UARTand another is needed to talk to an external device such as a rig, GPS, orweather device, a "software" UART can be easily created from numerousexample implementations available on the web.What kinds of applications were y'all considering when you mentioned ZigBee??_____ From: ntms-hsmm@yahoogrou <mailto:ntms-hsmm%40yahoogroups.com> ps.com [mailto:ntms-hsmm@yahoogrou <mailto:ntms-hsmm%40yahoogroups.com> ps.com] On BehalfOf John ChampaSent: Friday, May 23, 2008 3:49 PMTo: ntms-hsmm@yahoogrou <mailto:ntms-hsmm%40yahoogroups.comSubject> ps.comSubject: RE: [ntms-hsmm] IEEE 802.15.4 & ZigBeeTry this one...Those links didn't make it through the reflector too well, did they (HI).Try this one:https://digi.<https://digi. <https://digi.webex.com/mw0305l/mywebex/default.do?nomenu=true&siteurl=digi&service=6&main_url=https%3A%2F%2Fdigi.webex.com%2Fec0600l%2Feventcenter%2Fevent%2FeventAction.do%3FtheAction%3Ddetail%26confViewID%3D195840585%26siteurl%3Ddigi%26%26%26Other> webex.com/mw0305l/mywebex/default.do?nomenu=true&siteurl=digi&service=6&main_url=https%3A%2F%2Fdigi.webex.com%2Fec0600l%2Feventcenter%2Fevent%2FeventAction.do%3FtheAction%3Ddetail%26confViewID%3D195840585%26siteurl%3Ddigi%26%26%26Other>webex.com/mw0305l/mywebex/default.do?nomenu=true&siteurl=digi&service=6&main_url=https%3A%2F%2Fdigi.webex.com%2Fec0600l%2Feventcenter%2Fevent%2FeventAction.do%3FtheAction%3Ddetail%26confViewID%3D195840585%26siteurl%3Ddigi%26%26%26Other wise just go to www.digi.comTo: ntms-hsmm@yahoogrou <mailto:ntms-hsmm%40yahoogroups.comFrom> ps.comFrom:kilgore1317@ <mailto:kilgore1317%40sbcglobal.netDate> sbcglobal.netDate:Fri, 23 May 2008 15:02:57 -0500Subject: Re: [ntms-hsmm] IEEE 802.15.4 &ZigBeeWhat is the URL?DougJohn Champa wrote:> > >Possible interest....> >FreeWebinar: Introduction to ZigBee Mesh Networking>- Sponsored by DigiInternational ->Title: Introduction to ZigBee Mesh Networking>Date:Wednesday, May 28, 2008Time: 2:00 pm Central Daylight Time (GMT -05:00,Chicago) >Register to Attend>Webinar Summary: What are 802.15.4 and ZigBeeRand how do they compare to other wireless technologies? Speaking of presentations at the Plano Hamcom in two weeks... I would really enjoy it if someone would talk about any digital video links being set up and used either through modified 802.11 wireless routers or other means. We have quite a vast network of digital audio links built up between Echolink and IRLP but I have seen no discussion about digital video networks over the ham bands or linked to the internet.

What's the cheapest way to send digital video using the latest off the shelf hardware and software? I saw some video security camera systems at Fry's that seemed to claim that you can monitor a camera remotely over the internet. Can this be leveraged into Ham ATV use? I have a Cannon power shot A530 camera that has a USB port and it can record avi video as well as still shots. Is there any way I can use this as my digital video source and route the video to my local ATV repeater?

It would be great if an ATV repeater in one city could be digital video linked to other ATV repeaters in other parts of the country with a system similar to what echolink does for audio.

Let me know if you have any other ideas.

Is anyone in the NTX area using SR9 or XR9 radios?

I've read elsewhere that the 900MHz band would be a poor choice for
hsmm due to the potential presence of AM ATV and the
bandwidth of 802.11 modulation (covering much of the 900MHz band).

Is AM ATV used in the dfw and/or north texas area?

thanks,
robert

Craig,

The RCARC in Richardson is working on a several mile long HSMM link between W5ROK and one of our member stations. Once we have the link up and running we have thought about using a webcam to send one-way ADV (Amateur Digital Video) over the link. We would probably use the NetMeeting software which comes with the MS Windows XP OS.

We will probably be on Channel 3 (pending the results and analysis of our area survey and link analysis) using 1W BDA with AGC into a long yagi to give an EIRP of ~30W.

Our SSID of w5rok-2 will use WEP with a 128-bit key for protection.

Hope that helps.

From: J. Beadles
Topic: 1261 Message: 1261

Getting very close to too late for Hamcom presentations. I'm sending out the presenter detailed schedules today. After that, it gets extremely difficult to modify the schedule. Friday is open, Sat morning is completely full, but there are a few late Sat afternoon slots open. Sat evening is open, but they won't draw a lot of people.

The Austin HSMM SIG uses the following Airlink101 IP-Video cameras:

<http://www.airlink101.com/products/aic250w.html>

They go on sale periodically at Fry's Electronics for about $50.00. The cameras are color, have no audio but are IP cameras. That is, they serve up live video in a web browser that supports Direct X or Java (IE or Firefox for example). The video stream is compressed JPEG.

We attach these cameras to our mesh nodes and if the node is in range, you can see the camera video stream. The mesh nodes have a special firmware load that uses Optimum Link State Routing (OLSR) to auto link the nodes when they are within RF range. We are currently using Linksys WRT54GL hardware, for the mesh nodes, but have a variety of wireless router boards we are working with to support more bands and provide more on board data storage.

Since you view the video with a web browser, it is easy to use. There are better cameras out there, but we have not found a better value. (You can spend way more then $50.00 on an nice lens alone).

We have used the cameras to provide 2 way ATV associated with VoIP , again linked with our mesh nodes.

We are setting up links in the Austin area to augment the emergency radio system we have installed in local hospitals and EOC ham shacks.

<http://www.your-website-in-24-hours.com/travishams/tcares.org/index.php?option=com_content&task=blogcategory&id=14&Itemid=26>

Three of the most active members of the Austin HSMM SIG are packing up and heading to west Texas for the Texas Star Party that runs for a week, starting next Sunday. Last year we did HSMM IP-Video links between the McDonald Observatory and the scenic lookout in the Davis Mountains State Park. This was a link of about 8 miles, and worked well. The time to extablish the link, once on site, was under 30 minutes - the time needed to set up the tripod, mast, antenna, camera and computer.

(We have done 10 mile links across downtown Austin on 30mw, simply using good high gain antennas, and well chosen station

sites.)

The Airlink camera could not be much easier to use. It serves up a web page with live video, itself - no computer is needed to frame grab and convert the camera data.

We have used the Airlink cameras mobile. They are assigned a static IP in our mesh network, so if you sit on the camera address, and occasionally do a web page refresh, when the mesh node supporting the camera is within RF range the video will start to flow. Loose the link, and the video freezes with the last frame received. Reestablish the link in a few seconds, and the video just starts to flow again, with no user intervention. If the link is lost for a few minutes, the browser times out, and you have to hit the refresh icon.

We are planning to do more testing of the mesh nodes and the IP-Video cameras at the TSP this year. I have 5 of the video cameras ready to go.

The TSP is held at the Prude Ranch, just outside Ft. Davis TX. Hams lay down an AC electrical grid to power laptops and and motor driven telescopes for ~ 800 amateur astronomers. The hams also bring in Internet access and distribute it via 802.11A backbone links to 802.11b/g links around the ranch. At any one time, over 200 laptops are active on the Internet.

<http://www.texasstarparty.org/>

Check this URL for a information regarding ham radio operations at TSP and the special events station W5TSP.

<http://www.texasstarparty.org/>

Note, this year TSP runs June 1 thru June 8th. Some of the TSP web page does not reflect the correct date.

The compressed JPEG video uses relatively little bandwidth and we have had 6 live video streams going at the same time and still had bandwidth to spare.

All,

I'm in the process of setting up an HSMM link between my home QTH and my club's shack which is about 3.5 miles away. I'm pretty sure will work with the directional antennas we have because it is a direct line of sight (verified by my binoculars from my roof.)

Last weekend I drove around the link path using a laptop and an external antenna on the truck running NetStumbler connected to my GPS. I have a data file that contains the coordinates along with the standard stuff that NetStumbler collects.

My question is how can I get the data from NetStumbler into some kind of map display. I'm sure somebody has done that before...

If you have cygwin on your Windows machine, perhaps gpsmap, shipped with
kismet, would suffice. Documentation on gpsmap can be found here:
http://www.kismetwireless.net/documentation.shtml

I haven't used this software, but probably will have some experience in
a week or so. ;)

Thanks for the info, Glenn! This is the lowest cost and most simple off the shelf digital solution I've seen so far. It looks like the regular price at Fry's is $99. I'm thinking of getting one now and then when they go on sale picking up a few more. It would be outstanding if we could get the creators of Echolink to add these cameras to their server so one could log in and connect to anyone serving video around the world just as is done with voice today.

From: Kilgore
Topic: 1268 Message: 1268

At the June 9 Richardson Wireless Klub meeting, we will be honoring Austin Wilmot KD5QKS who is the recipient of the ARRL 2008 Goldfarb Memorial Scholarship. This is the most prestigious scholarship given away each year to only one ham. Austin got his license in 2001 while attending an after-school ham class taught by members of RWK.

I would like to set up a live, 2 way audio-video link with ARRL Foundation personnel using Skype over the internet. I have a digital web-cam built into my laptop that will work from my direction.

Who has a web-cam that can work on their computer and a Skype account? I would like to test out this process soon.

Glenn, I went over to Fry's yesterday but they only had the 500W for $119. Are there any compatibility issues between the 250W and the 500W?

Also, has anyone tried disconnecting the camera from the Airlink101 devices and feeding it instead with external video from an ATV repeater. It would be great if we could figure out a way to see ATV repeater video over the web with a simple browser.

Craig,

I have not worked with the 500W. I will have to look it up.

Also, I have not tried to open up the camera and tried to feed in video from an outside source. I don't know how they are doing the video sampling, or if the video ever exists in NTSC format anywhere in the camera.

Anyone that opens one up and can figure out how the camera is connected to the rest of the system to produce the JPEG output, let us know.

As for being compatible, there are a variety of IP-Cameras on the market. The higher quality ones have higher resolution, and put more data onto the network. All of the IP cameras I have worked with could be displayed on a web browser. Some have additional software that can do things like blow up the image to fill the entire computer screen etc. So the cameras will have differences, but all IP video cameras are designed to send video over a network link so they don't all have to use the exact same frame rate and resolution. The computer displaying them must be capable of decoding and displaying the data.

I am sending this message using an old 200MHz Toshiba laptop. It works well in the field as it seems to be much tougher than some of the newer equipment I have. Anyway, it can only display one browser showing video. The limitation is the bandwidth of the computer. I can open several browser windows, and I can get video in each one, but the computer cannot manage the full frame rate on each video dispaly. A faster computer has no problems keeping up with the frame rate on multiple camera displays. The video degrades gracefully though. Each frame is clear, it just drops frames if it gets too far behind, so the effective frame rate is lower.

We can get multiple of the cheap AirLink cameras on one wireless link because they are relatively low res and thus sending less data than a hi res camera.

There is lots to tinker with and it is fun for technical types. I am learning more all the time. Luckily you don't have to understand everything to get started. With a few of the basics you can begin to experiment and dig as deep into the technical issue as you please. With devices like the little AirLink cameras, the cost of entry to digital video has come way down. I would encourage others to get on the air and experiment with the gear. I am sure there are many interesting ways the equipment can be used. If you set up the radio links using Part-97 rules, you have digital ATV, right out of the box!

-Glenn

Craig <wd5bdx@...> wrote:

Glenn, I went over to Fry's yesterday but they only had the 500W for $119. Are there any compatibility issues between the 250W and the 500W?

Also, has anyone tried disconnecting the camera from the Airlink101 devices and feeding it instead with external video from an ATV repeater. It would be great if we could figure out a way to see ATV repeater video over the web with a simple browser.

I have used the D-Link DCS-(G)900 IP camera over 802.11. I chose that camera because there is Linux software for it, in addition to it's own built in web-server/viewer.
http://panteltje.com/panteltje/mcamip/

I successfully used this to monitor one of the our club sites that we have soda machine at. We had some vandalism going on at that site, so I put the D-Link camera up and would watch it from home over with wireless network.

I was using an analog PTZ camera with the Osprey video capture and the VLC streaming server to deliver streaming video over WiFi at the Christmas parade. The only real problem is the processing overhead to compress the stream - 2ghz or better required to compress and stream from a single computer. (I didn't have quite that much and ended up having to use 2 machines).. since the Osprey is NTSC input, you can use just about any camera.

The other problem was line of site to the far end :-) but the video portion worked great :-)

Is anyone really doing ATV any more ?? I asked around a few months back and the impression I got is that ATV has pretty much died.

Since ATV wants a standard NTSC input, the only way you are going to link a digital stream to an ATV transmitter is by using a video card with TV out, probably as a secondary display on the computer connected to the net. The Osprey card or any other supported by the VLC streaming encoder would do fine for encoding the video - preferably one that has on board compression to reduce the work load on the host computer.

If you wanted to do a network like Echolink/IRLP, all that is really needed is a registration web server and some simple software that will keep the registration server notified of active video sources running on the machine sourcing the video stream. At the "receiving" end, viewers could pick up a stream by installing the VLC player and clicking a link on the website to access the stream. Setting up the player to display on a TV-out card would allow the video to be routed to an ATV transmitter.

Using anything that doesn't put out standard NTSC presents a problem delivering the video to an ATV transmitter.. most web cam type video devices have low resolution and don't look all that good when blown up to full screen even at 640x480 TV resolution. However, if video quality isn't that much of an issue, then if there is a way to capture to a stream from your camera, rather than to a file, it can be made to work. Also note that many web cam type devices do not output at full 30 frames per second, but that doesn't matter much once the stream is fed to a TV-out card.

VLC player and server are available free for most any platform out there - Winblows, McCrap, Limpux :-)

Hope that gives you a few ideas :-)

There are lot's of ATV activity still going on I have done a cut and paste of a ATV newsletter of a group of folks that are streaming their ATV repeaters to the Internet. At my RFhamcams Yahoo group we talk a lot about this issue....here is the news letter.....

ATV Newsletter
*June 3, 2008 *Circulation 1100+
Vol. 1 No. 43

In this Edition:
* World News this Week
* BATC Press Release *Exciting News*
* ATV Contacts Wanted
* Another New Camstream K8DMR
* San Bernardino Microwave Society Meeting
* *Are Camstreams BAD? *
* World Wide ATV Open House
* Digital-ATV
* Buy-Sell-Trade
* ATV Guide
* ATV Website Guide
* Internet Viewers
* This weeks Joke
* Local News
* Repeater Reports
** Oat Mtn. lost all audio.*
* Repairs Needed
* Letters to the Editor

World News this Week

BATC Press Release
"British Amateur Television Club"
I received this email and it is exciting news for ATV.

Bryon
The Streamer hardware should get installed tonight,
I hope GB3BH soon gets linked in and then other follow
Press release below cleared to use
Trevor

www.batc.tv <http://www.batc.tv/> is the latest venture by the BATC into Television
streaming. The site will bring streamed ATV to the internet and allow cross repeater working from its multi screen display. The site will also

carry a library of ATV programmes and be a port for other ATV events
that will be streamed from around the world.

Some of you may have already seen Camstream and other repeater
streaming, how will this site differ? The software has been written
To allow multi user display, so that more than one repeater can be
viewed at the same time allowing CQ ATV to be called on one repeater and
others monitored for a duplex QSO. In the past using single repeater
monitoring this has been possible but only a single repeater could be
monitored and delay was a major problem.

www.batc.tv <http://www.batc.tv/> will be located in the Telehouse,
Docklands data centre
here in the UK and connected to a major internet pipe to minimise
delays. The streamer will use flash media so the picture quality will be
the very best that modern technology can provide at the present time.

This is an expensive venture and although no charge will be made to ATV
repeater groups for streaming we are looking for other users and
sponsors to help make this site a place to visit. Ventures from other
users are not restricted to ATV or even ham radio. If you would like to
start your own streaming service then please contact us - we have the
necessary space available.

If you are a company and would like to help support this project, then
for a small donation we can display and hyper link your logo from our
front page.

If you would like to stream your repeater or have a live event coming up
you would like to stream or if you have library ATV material suitable
for this site, please contact _info@..._ <mailto:info@...>
****
It is great to see that people are thinking BIG when it comes to ATV and
not small.

Ian helped me get the ATV Newsletter off the ground in the UK and I consider him a good friend. N6IFU
****
Another New Camstream
I received an email from Ron, K8DMR and he wanted me to let you all know that he has establish yet another Canstream for ATV. His URL is _http://k8dmr.camstreams.com_ <http://k8dmr.camstreams.com/>
****
San Bernardino Microwave Society Meeting
The SBMS meeting is this coming Thursday June the 5th.
*The "Tech Talk" this month is: *
"Digital Signal Processing"
Presented By Dr. Prentiss Robinson
SBMS Meetings are always worth watching.
It starts at 7:00 PM PT and runs to 9:00 PM

You can watch it via the *AC6RB Camstream*
go to _www.ac6rb.com_ <http://www.ac6rb.com/> and click on option #1 or #2

I will be logging all Internet Viewers and checking them in to the meeting via ATV

I also saw W6KVC, Gary testing his ATV equipment this week. He has some new equipment for production and broadcast of the SBMS meeting. If you haven't watched the SBMS meeting it's a great example of excellent production quality due to Gary's hard work. And the SBMS should consider it's meetings and Tech Talk be added to the BATC video Library.

Are Camstreams BAD?

I have tried to think of any negative that might be associated with the use of Camstreams or Ustreams in conjunction with with ATV but I have never been able to think of one reason until I heard a Ham on my local network express his reason.

He was telling another Ham that he thought the Camstream on our network was great for our Net but he thought it shouldn't be on 24/7. He went on to say it makes him feel like people were looking in his windows by having it on 24/7 and it should be turned off.

I thought about his objection and it became clear to me that when you are on HF, anyone with a short wave radio can listen in. And on UHF and VHF anyone with a scanner can listen in. So what is he afraid of people seeing and hearing?

If he is operating his ATV Station in accordance with FCC Laws why is he concerned about someone watching the camstream. It makes me feel that he has something to hide.

I don't think he knows how silly his objection sounds and if he thinks people are looking in his windows he shouldn't turn on his ATV transmitter and no one will be able in look in his windows.

I think this Ham's comments shouts out a good reason for having a Camstream on your ATV repeater. If someone is breaking the law we all should take steps to keep ATV above reproach by policing it ourselves.

Last week the President of ATN-CA Don KE6BXT put a letter in the newsletter asking for anyone seeing objectionable language or images on the ATN-CA repeaters should contact him at _donhill@..._ <mailto:donhill@...> *Good for you Don! *I am sure Don and the club officers will keep your identity confidential.

//
Oat Mtn.: On Sat. I was having a QSO with KG6CO Ray at 2:30 PM and I lost his audio. When he sent it back to me and I keyed up my transmitter I couldn't hear myself coming back from Oat Mtn.. Later I was able to do some testing with Don KE6BXT when he logged into AC6RB's Camstream and I could explain what was going on. Oat and Santiago can see each others pictures just as it should be. Santiago does not receive any audio via the ATV audio carrier from Oat so they can't hear us. We are also unable to hear any audio via the ATV audio carrier from Oat as well as Santiago. N6IFU
Mt. Wilson:
Snow Peak:
Point Loma:
Santa Barbara:
Mt Potosi:
Santiago Peak (network hub):
Blueridge:
_____
Repairs Needed for the ATN-CA Repeaters
_____
Blueridge:
1. Once Mt. Potosi has it's link operational Blueridge can reestablish it's receive link
and make any adjustments needed.
Santa Barbara:
1. Reestablish link to Santiago.
Mt. Wilson:
1. Install 2.4 GHz Receiver ????
2. Build and install 2.4 GHz receiver for link from Blueridge (on hold 5/5/08)
3. Might need an additional port on the controller????
Oat Mtn.:
1. Replace plastic wire ties with appropriate fasteners.
2. Tune 2.4 GHz link dipole for better SWR. It would be a good idea to sweep the
1200 MHz antenna at the same time as well.
Santiago Peak:
1. Remove KC6UQH's call and Palomar from the W6ATN repeaters ID's (late spring
early summer when the new controller is installed)
2. Look into weak signal getting into one of the inputs.*
**Snow Peak:
*1. Repair the Snow Peak Repeater/link.
Point Loma:
1. Install link radios and establish link to Santiago. (Planned by April 29th)
Mount Potosi:
1. Reestablish link to Blueridge

1274. RE: [ntms-hsmm] Re: Are any hams sending digital video? How about a Hamcom presentation?

Yahoo group: DAWG-HSMM
Date: 2008-06-02 02:03:04 UTC
From: John Barrett
Topic: 1251 Message: 1274

OK - I'll rephrase that - there isn't much ATV happening here in the DFW area.

I originally wanted to set up ATV for my camera feed, but was convinced to go WiFi because there were not a lot of people with ATV hardware in the area.

From: ntms-hsmm@yahoogroups.com [mailto:ntms-hsmm@yahoogroups.com] On Behalf Of KD5LWU Johnny

World News this Week

BATC Press Release
"British Amateur Television Club"
I received this email and it is exciting news for ATV.

Bryon
The Streamer hardware should get installed tonight,
I hope GB3BH soon gets linked in and then other follow
Press release below cleared to use
Trevor

www.batc.tv <http://www.batc. <http://www.batc.tv/> tv/> is the latest
venture by the BATC
into Television
streaming. The site will bring streamed ATV to the internet and allow
cross repeater working from its multi screen display. The site will also
carry a library of ATV programmes and be a port for other ATV events
that will be streamed from around the world.

Some of you may have already seen Camstream and other repeater
streaming, how will this site differ? The software has been written
To allow multi user display, so that more than one repeater can be
viewed at the same time allowing CQ ATV to be called on one repeater and
others monitored for a duplex QSO. In the past using single repeater
monitoring this has been possible but only a single repeater could be
monitored and delay was a major problem.

www.batc.tv <http://www.batc. <http://www.batc.tv/> tv/> will be located
in the Telehouse,
Docklands data centre
here in the UK and connected to a major internet pipe to minimise
delays. The streamer will use flash media so the picture quality will be
the very best that modern technology can provide at the present time.

This is an expensive venture and although no charge will be made to ATV
repeater groups for streaming we are looking for other users and
sponsors to help make this site a place to visit. Ventures from other
users are not restricted to ATV or even ham radio. If you would like to
start your own streaming service then please contact us - we have the
necessary space available.

If you are a company and would like to help support this project, then
for a small donation we can display and hyper link your logo from our
front page.

If you would like to stream your repeater or have a live event coming up
you would like to stream or if you have library ATV material suitable
for this site, please contact _info@... <mailto:_info%40batc.tv> _
<mailto:info@... <mailto:info%40batc.tv> >

<http://k8dmr.camstreams.com/> camstreams.com/>
****
San Bernardino Microwave Society Meeting
The SBMS meeting is this coming Thursday June the 5th.
*The "Tech Talk" this month is: *
"Digital Signal Processing"
Presented By Dr. Prentiss Robinson
SBMS Meetings are always worth watching.
It starts at 7:00 PM PT and runs to 9:00 PM

You can watch it via the *AC6RB Camstream*
go to _www.ac6rb.com_ <http://www.ac6rb. <http://www.ac6rb.com/> com/> and
click on option #1 or #2

I will be logging all Internet Viewers and checking them in
to the meeting via ATV

I also saw W6KVC, Gary testing his ATV equipment this week. He has some
new equipment for production and broadcast of the SBMS meeting. If you
haven't watched the SBMS meeting it's a great example of excellent
production quality due to Gary's hard work. And the SBMS should consider
it's meetings and Tech Talk be added to the BATC video Library.

Are Camstreams BAD?

I have tried to think of any negative that might be associated with the
use of Camstreams or Ustreams in conjunction with with ATV but I have
never been able to think of one reason until I heard a Ham on my local
network express his reason.

He was telling another Ham that he thought the Camstream on our network
was great for our Net but he thought it shouldn't be on 24/7. He went on
to say it makes him feel like people were looking in his windows by
having it on 24/7 and it should be turned off.

I thought about his objection and it became clear to me that when you
are on HF, anyone with a short wave radio can listen in. And on UHF and
VHF anyone with a scanner can listen in. So what is he afraid of people
seeing and hearing?

If he is operating his ATV Station in accordance with FCC Laws why is he
concerned about someone watching the camstream. It makes me feel that he
has something to hide.

I don't think he knows how silly his objection sounds and if he thinks
people are looking in his windows he shouldn't turn on his
ATV transmitter and no one will be able in look in his windows.

I think this Ham's comments shouts out a good reason for having a
Camstream on your ATV repeater. If someone is breaking the law we all
should take steps to keep ATV above reproach by policing it ourselves.

Last week the President of ATN-CA Don KE6BXT put a letter in the
newsletter asking for anyone seeing objectionable language or images on
the ATN-CA repeaters should contact him at _donhill@gmail.
<mailto:_donhill%40gmail.com> com_
<mailto:donhill@gmail. <mailto:donhill%40gmail.com> com> *Good for you Don!
*I am sure Don and the
club officers will keep your identity confidential.

//
Oat Mtn.: On Sat. I was having a QSO with KG6CO Ray at 2:30 PM and I
lost his audio. When he sent it back to me and I keyed up my transmitter

I couldn't hear myself coming back from Oat Mtn.. Later I was able to do some testing with Don KE6BXT when he logged into AC6RB's Camstream and I could explain what was going on. Oat and Santiago can see each others pictures just as it should be. Santiago does not receive any audio via the ATV audio carrier from Oat so they can't hear us. We are also unable to hear any audio via the ATV audio carrier from Oat as well as Santiago. N6IFU

Mt. Wilson:

Snow Peak:

Point Loma:

Santa Barbara:

Mt Potosi:

Santiago Peak (network hub):

Blueridge:

_____

Repairs Needed for the ATN-CA Repeaters

_____

Blueridge:

1. Once Mt. Potosi has it's link operational Blueridge can reestablish it's receive link
and make any adjustments needed.

Santa Barbara:

1. Reestablish link to Santiago.

Mt. Wilson:

1. Install 2.4 GHz Receiver ????
2. Build and install 2.4 GHz receiver for link from Blueridge (on hold 5/5/08)
3. Might need an additional port on the controller????

Oat Mtn.:

1. Replace plastic wire ties with appropriate fasteners.
2. Tune 2.4 GHz link dipole for better SWR. It would be a good idea to sweep the
1200 MHz antenna at the same time as well.

Santiago Peak:

1. Remove KC6UQH's call and Palomar from the W6ATN repeaters ID's (late spring
early summer when the new controller is installed)
2. Look into weak signal getting into one of the inputs.*

**Snow Peak:

*1. Repair the Snow Peak Repeater/link.

Point Loma:

1. Install link radios and establish link to Santiago. (Planned by April 29th)

Mount Potosi:

1. Reestablish link to Blueridge

1275. Re: [ntms-hsmm] Re: Are any hams sending digital video? How about a Hamcom presentation?

Yahoo group: DAWG-HSMM
Date: 2008-06-02 02:16:51 UTC
From: KD5LWU Johnny
Topic: 1251 Message: 1275

I understand - we at our Yahoo group have been discussing ATV via WiFi for several years but have not actually made much movement. I would love to see ATV repeaters using both webcams, WiFi and the Internet. The difficulty is capturing the webcam video and converting to a digital form. I would love to see much much more ATV activity then what is out there as I think it is a modality that is great for public service. I bought one of the MFJ video chips and set it up as a mobile ATV camera several years ago and will be using it during our next field day event this month....it is running on UHF. 73 Johnny

> *Presented By Dr. Prentiss Robinson*
> SBMS Meetings are always worth watching.
> It starts at 7:00 PM PT and runs to 9:00 PM
>
> You can watch it via the *AC6RB Camstream*
> go to _www.ac6rb.com_ <http://www.ac6rb. <http://www.ac6rb.com/
> <http://www.ac6rb.com/>> com/> and
> click on option #1 or #2
>
> I will be logging all Internet Viewers and checking them in
> to the meeting via ATV
>
> I also saw W6KVC, Gary testing his ATV equipment this week. He has some
> new equipment for production and broadcast of the SBMS meeting. If you
> haven't watched the SBMS meeting it's a great example of excellent
> production quality due to Gary's hard work. And the SBMS should consider
> it's meetings and Tech Talk be added to the BATC video Library.
>
> *Are Camstreams BAD?*
>
> I have tried to think of any negative that might be associated with the
> use of Camstreams or Ustreams in conjunction with with ATV but I have
> never been able to think of one reason until I heard a Ham on my local
> network express his reason.
>
> He was telling another Ham that he thought the Camstream on our network
> was great for our Net but he thought it shouldn't be on 24/7. He went on
> to say it makes him feel like people were looking in his windows by
> having it on 24/7 and it should be turned off.

>
> I thought about his objection and it became clear to me that when you
> are on HF, anyone with a short wave radio can listen in. And on UHF and
> VHF anyone with a scanner can listen in. So what is he afraid of people
> seeing and hearing?
>
> If he is operating his ATV Station in accordance with FCC Laws why is he
> concerned about someone watching the camstream. It makes me feel that he
> has something to hide.
>
> I don't think he knows how silly his objection sounds and if he thinks
> people are looking in his windows he shouldn't turn on his
> ATV transmitter and no one will be able in look in his windows.
>
> I think this Ham's comments shouts out a good reason for having a
> Camstream on your ATV repeater. If someone is breaking the law we all
> should take steps to keep ATV above reproach by policing it ourselves.
>
> Last week the President of ATN-CA Don KE6BXT put a letter in the
> newsletter asking for anyone seeing objectionable language or images on
> the ATN-CA repeaters should contact him at _donhill@gmail.
> <mailto:_donhill%40gmail.com> com_
> <mailto:donhill@gmail. <mailto:donhill%40gmail.com> com> *Good for you
> Don!
> *I am sure Don and the
> club officers will keep your identity confidential.

> *Amateur Television Repeater Controllers*
> ATVC-4 Plus is Intuitive Circuit's second generation Amateur Television
> repeater controller.
> Some of the many features that the ATVC-4 includes are:
> ** Five Video Input Sources*
> ** Four Mixable Audio Input Sources*
> ** Non-volatile Storage *
> ** DTMF Control*
> ** Beacon Mode*
> ** Robust CW Feedback*
> ** Password Protected*
> ** And Many More Features*
> For example a major new feature is four individual sync detection
> circuits allowing for true priority based ATV receiver switching.
> Only $349.00
> Contact: Intuitive Circuits, LLC 3928 Wardlow Ct., Troy, MI - (248)

I understand - we at our Yahoo group have been discussing ATV via WiFi for several years but have not actually made much movement. I would love to see ATV repeaters using both webcams, WiFi and the Internet. The difficulty is capturing the webcam video and converting to a digital form. I would love to see much much more ATV activity then what is out there as I think it is a modality that is great for public service. I bought one of the MFJ video chips and set it up as a mobile ATV camera several years ago and will be using it during our next field day event this month....it is running on UHF. 73 Johnny

1278. extend range on WIFI

Yahoo group: DAWG-HSMM

From: icra@galaxynet.com
Topic: 1277 Message: 1278

OK....let us see if there really is anyone around on this list....

Setting up a WIFI network for another ham and his wife

Router is on one end of the house, wifes computer is on the other

Got his laptop working on it just fine (same room...real hard to do), got the card working on
the wifes computer....not enough signal strength to link with the router....

Will be trying to re-locate the router by a window that looks towards the room with the wifes
computer

Was thinking of trying a sort of passive repeater system...couple of the pringles can antennas
linked with some RG-59 coax I have laying around....would it work or just be a waste of time?

A passive antenna would be a waste of time.

A couple of things to try.

Get the router as high as possible in the room. All objects between it and the wife's computer attenuate the signal. Usually furniture and people are in the way. I put my house router on top of the entertainment center in the center of the house. It is over 6' off the ground and I can hit it from everywhere in the house.

☐Try a different channel. Most routers default to channel 6. If all your neighbors are also on channel 6 you may have a lot of noise. Try channel 1 or 11. (Channels 1, 6, and 11 do not overlap)

Experiment with the router position. The Linksys routers have two antennas, because sometimes a movement of 6" is enough to make a difference.

Get a directional antenna. 3 db is twice the range. 15 db directional antennas are pretty cheap. (Make sure the polarity is setup the same.) I do not know what the gain of a pringles can antenna is, but if

everything else does not work you can try it before you buy a directional antenna.

We have gotten 10 miles reliability with a pair (19db and 24 db) of directional antennas.

Let is know your progress.

This one defaulted to channel 1

He lives on a 10 acre lot...none of those living around him have WIFI

It is a large house, 2 car garage, then his office, shop, and shack....lots of walls to go through....at best, 5 walls to go though (one of them length wise)...why I was thinking the passive repeater might work better...could put an antenna by the window of her office, run coax along the eaves along the back of the house, put the other antenna outside the window of his office

> Experiment with the router position. The Linksys routers have two
> antennas, because sometimes a movement of 6" is enough to make a
> difference.
>
That is the next step....he would really like to put it in the untiliies closet, but that dropped a
marginal signal down to no signal. His office has a window that faces along the back of the house...soon as we make up a CAT-5 cable from the closet to the window, will try it there

> Get a directional antenna. 3 db is twice the range. 15 db

Wife does not want cables in her office and the router he picked up does not have external antenna or jacks (part of the problem and part of why I was thinking of a passive repeater)

Lots of fun working within some one else's limits....If it was me, I would have just gone with a
wired network in this house (even with almost no way to run the cable). At least he went with
802.11N devices....

Will see if moving the router fixes the situation. If not, may be able to talk him into buying
another router (this time, with external antenna/jack that would allow for a directional antenna)

Need a router with an external antenna.

Other option is to go high. If he lets you run a cable to the attic you may be able to get the number of walls the signal has to go through lowered.

There were problems with N a while back. Probably fixed by now. We sometimes switch to 802.11b to get better range. It is slower but has better sensitivity.

What about the walls of the house?

Is there foil-backing on the insulation?

Is everything on a single floor?

Single story house

Know there is foil on the exterior walls.....not sure what all garbage is in the interior walls

And I was wrong on the number of walls to go through....there are 7....one of them length wise, 2 are in the garage and have foil backing on the insulation.....

Tomorrow or Wed we will move the router by the window and see what that gets us

Well,

Two ideas come to mind.

1. Relocate the wireless access point closer to where it's being used. Moving it to a central closet or something should be fairly easy if you are not afraid of pulling a bit of CAT5 around the house. I have 2 access points that pretty much cover my whole lot using this technique.

2. Get an active repeater and put that closer to where you want to use the wireless link. D-Link sells them I believe for around $100. You just need a place to plug it in after you configure it that is within rang of the primary router.

I'd generally stay away from antennas with gain or any long coax runs. The antennas might work, but they may violate Part 15 rules for signal strength. Coax runs are very lossy at this frequency unless you use some really expensive stuff and if you can pull coax, Cat 5 would be easier and cheaper.

Subject: [ntms-hsmm] extend range on WIFI

OK....let us see if there really is anyone around on this list....

Setting up a WIFI network for another ham and his wife

Router is on one end of the house, wifes computer is on the other

Got his laptop working on it just fine (same room...real hard to do), got the card working on
the wifes computer.... not enough signal strength to link with the router....

Will be trying to re-locate the router by a window that looks towards the room with the wifes
computer

Was thinking of trying a sort of passive repeater system...couple of the pringles can antennas
linked with some RG-59 coax I have laying around....would it work or just be a waste of time?

Asterisk PBX http://www.asterisk.org/about

besides standard VoIP phone support for stand alone phones and PC phone software, they have recently added some features to support repeater linking.

    Posted by: "Ford, Steve, WB8IMY" sford@...
    Date: Tue Jul 15, 2008 6:17 am ((PDT))

Technical papers are solicited for presentation at the 27th Annual ARRL
and TAPR Digital Communications Conference to be held September 26-28,
2008 in Chicago, Illinois. http://www.tapr.org/dcc.html

These papers will also be published in the Conference Proceedings
(you do NOT need to attend the conference to have your paper included in the Proceedings).

The submission deadline is July 31.

Please send papers to:
Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

Definitely Asterisk is extremely good, there's couple of iso images that are ready to go.

Take a look at Trixbox,

EasyVoxBox

and the new ACID (Allstar Centos Installation Disk).

EasyVoxBox and ACID both have the necessary components to go online quickly with radio and voice connectivitiy.

A good Softphone include:

X-Lite

and

Zoiper.

A good "console to console" voice package is IP-Sound (don't know if it is still available on the Internet or not).

Program? How about speakfreely.
For a platform try Asterisk
Protocols of my own preference are SIP and IAX.

If you wanted an integrated device, look into a Wifi Phone.

Those are my suggestions

What we would like to do is use a Linksys router/AP on a mountain top tower as basically a repater but on wifi 802.11(not connected to the internet)to allow voip around the local area for hams wishing to experiment!!! How exactly step by step would this be accomplished as we are not IT experts? Thanks, Brian nb9e

OK -- this is off the top of my head -- so it wont be complete, but enough to get started

Set up linksys on and oddball subnet (192.168.100 maybe) with DHCP and encryption. I personally reset the DHCP range to 100-200 on mine to leave space at the bottom for servers. If you are using a flashed Linksys (DDWRT, OpenWRT, whatever) Configure to redirect web traffic to the asterix server.

Configure server with wireless card and directional antenna, install one of the asterix prebuilts, setup with static IP 192.168.100.2, and if you are redirecting web traffic, install a web server and set up pages to download the client software and any other instructions needed. You can use a web server integrated on the router if there is enough memory for the downloads.

This is the part where I'm floating ideas :) you are going to need either a manual process or a web application to associate client applications/devices with a phone number/extension, and you'll need a directory of assigned numbers. I havent worked with Asterix enough to know how easy or hard it will be to do a web app to configure new phones. The manual process would need to be a web page that requests name/callsign/device id info/username/password and stores that data so you can configure asterix and update the directory. The web app could collect the same data and do the config/update automatically if desired so users would not have to wait on a manual update.

Once a device is configured as a phone in asterix and the device itself is configured to find the asterix server, you should be good to go to make calls.. since the asterix server is not located with the router, you can even look at giving it a real phone line or internet phone connection and use it like a phone patch -- HamPBX :)

After testing all this in the shack, install the router on the the mountain, hand out the encryption keys to your friends/club/whatever and go to town :)

Some interesting side features you could add on would be radar feeds for storm spotters, discussion forums for user support, anything that could be accessed off the internet and fed out via the web server installed on the asterix server.

If you dont have anyone locally up to speed on web scripting, I'd be interested in helping out with the server if you dont mind setting up so I can remotely access the machine to do the work.

The ARRL/TAPR DCC (Digital Communications Conference) is being held in Chicago on September 26 - 28, 2008.

The DCC will be at the Elk Grove Village Holiday Inn located in Chicago's northwest suburbs near O'Hare airport with a free airport to hotel shuttle and easily accessible from major interstate highways.

The DCC is the premiere, national, annual digital ham radio conference covering ALL the Digital Voice & Data technologies from HF to Microwaves.

There will be BOTH Technical & Introductory presentations covering all levels of experience with the digital modes and also an ARRL forum.

This year for the first time at the DCC there will be a D-STAR Friday Night event. We plan to have innovators, pioneers & leaders in D-STAR digital voice & data technology available to present and take your questions.

Icom will be at the DCC and TAPR plans to have it's 70cm & 23cm D-STAR digital voice & data repeaters operating at the DCC connected to the internet gateway.

You can get more information about the DCC at: http://www.tapr.org/dcc.html
A DCC advertisement is attached that can be published in your local club newsletters.

Reigster before September 1st & save $10 on your registration fee.

You can register at:
https://www.tapr.org/dccregistration.php
Look forward to seeing everyone at the DCC.

ARRL, TAPR Prepare for Digital Communications Conference in Chicago, September 26 - 28

Aficionados of digital communications are gearing up for the 27th annual ARRL/TAPR Digital Communications Conference (DCC) September 26-28 in Chicago, Illinois. The ARRL/TAPR Digital Communications Conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. The DCC is for all levels of technical experience -- not just for the expert. Not only is the conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any aspect of amateur digital electronics and communications; introductory sessions are scheduled throughout the conference to introduce new technical topics for both beginners and experts.

Topics at the DCC include, but are not limited to: Software defined radio (SDR); digital voice (D-STAR, P25, WinDRM, FDMDV, G4GUO); digital satellite communications; Global Position System (GPS); precision timing; Automatic Position Reporting System (APRS); short messaging (a mode of APRS); Digital Signal Processing (DSP); HF digital modes; Internet interoperability with Amateur Radio networks; spread spectrum; IEEE 802.11 and other Part 15 license-exempt systems adaptable for Amateur Radio; using TCP/IP networking over Amateur Radio; mesh and peer-to-peer wireless networking; emergency and Homeland Defense backup digital communications; using Linux in Amateur Radio; updates on AX.25, and other wireless networking protocols.

QEX Editor Larry Wolfgang, WR1B, will represent the ARRL at the Conference. He will also be giving a talk "Writing for Publication -- It's Not Rocket Science (Even if You Are Writing About Rocket Science!)." Retired ARRL Chief Technology Officer Paul Rinaldo, W4RI, will also represent the League. Rinaldo will speak on "SDR Outlook."

The DCC provides a separate (and lockable) room for participants to bring and show off their latest projects. Tables and power will be provided. Participants are encouraged to bring their own equipment and display for all to see, learn, and ask questions about, as well as a small sign and/or flyer naming and describing their project.

D-STAR digital voice and data will be the focus of the DCC Friday evening session. Pioneers and leaders in D-STAR digital voice and data technology will be presenting the technical innovations in D-STAR and how it is being used worldwide. In addition to the Friday evening session, ICOM will be at the DCC demonstrating D-STAR radios in the demonstration room, and TAPR's 70 cm and 23 cm D-STAR digital voice and data repeaters (KT7APR) with Internet gateway will be on the air.

Sunday Seminar Speaker Announced

Each year, the DCC hosts an in-depth 4 hour seminar on Sunday. Past seminars have included such topics as Software Defined Radios, Spread Spectrum Design and Theory, RD Design and Deployment, PICmicro MCU Design and Development, Packet Radio Networks with Millions or Billions of Stations and others. Seminars are given by experts in their field -- this year is no different. Phil Harman, VK6APH, will present "Software Radio Through the Looking-Glass."

Harman, licensed for more than 40 years, has worked on leading-edge RF techniques related to receivers and transmitters. His current passion is the development of fully digital HF radios. Harmon co-writes the Software Defined Radio column in the RSGB Radio Communications journal and also co-authored the SDR chapter in the latest RSGB Handbook. He will guide participants through the basics of SDRs right up to the very latest techniques that digitize signals directly at the antenna socket. Using diagrams and a minimum of math, Harmon will cover such subjects as front end design, mixers, I and Q signals, digital up and down conversion, AGC techniques, noise blanking and high efficiency power amplifiers. The presentation will be highly interactive, so be sure to bring along that question that has been puzzling you for so long!

Conference presentations, meetings, and seminars will be held at the Holiday Inn Hotel Elk Grove Village, Illinois. It is highly recommended that participants book rooms prior to arriving. A block of rooms at the special DCC room rate of $89.00 single/double is available; this rate is good until the block is all sold out. The hotel provides a complimentary shuttle to and from O'Hare Airport.

Register for the DCC at: www.tapr.org/dcc

Topic: 340 Message: 1304

I wanted to give an update on these as I have been playing with them again. I feel these and the Ubiquiti NanoStations are the two best all around deals and best bets.

With the Aerocomm units we have observed solid non line of site mobile coverage for 3 miles. This is with a base station at 35 feet into a 6 dBd omni and just a mag mount on the car. There is still mobile coverage up to about 6 miles, it's just not solid.

For more info on these units:
http://www.qsl.net/n9zia/aerocomm/

Steve,

OK to publish your test results in CQ VHF?

1310. DCC (Digital Communications Conference) A Success & Returning to Chicago Next Year

Yahoo group: DAWG-HSMM
Date: 2008-10-08 22:19:20 UTC
From: Mark Thompson
Topic: 1310 Message: 1310

http://www.arrl.org/news/stories/2008/10/02/10371/?nc=1

ARRL/TAPR Digital Communications Conference: "Pretty Interesting!"

The main presentation room at the 2008 ARRL/TAPR DCC provided ample seating and tables, as well as power supplies, for laptops. [Larry Wolfgang, WR1B, Photo]

Kermit Carlson, W9XA (left), and Rick Muething, KN6KB, go over the final arrangements just before Muething's presentation on audio/visual equipment. Carlson coordinated the a/v for the DCC. [Larry Wolfgang, WR1B, Photo]

Almost 150 aficionados of digital communications came to Chicago for the 27th annual ARRL/TAPR Digital Communications Conference (DCC) the weekend of September 26-28. This conference is an international forum for radio amateurs to meet, publish their work and present new ideas and techniques. Presenters and attendees had the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. Not only was the conference technically stimulating, it was a weekend of fun for all who have more than a casual interest in any aspect of amateur digital electronics and communications; introductory sessions were scheduled throughout the conference to introduce new technical topics for both beginners and experts.

One of the attendees was QEX Editor Larry Wolfgang, WR1B, representing the ARRL. He gave a talk "Writing for Publication - It's Not Rocket Science (Even if You Are Writing About Rocket Science!)." Retired ARRL Chief Technology Officer Paul Rinaldo, W4RI, also represented the League, speaking on "SDR Outlook." Central Division Vice Director Howard Huntington, K9KM was present, as was ARRL Contributing Editor H. Ward Silver, N0AX.

Wolfgang gave his presentation on Friday morning and said he talked with many participants throughout the conference who told him that he had them enthused about writing something for QEX. "It also seemed like almost everyone there was making a point to stop me in the hallways or at mealtimes to tell me how much they are enjoying QEX, and to thank me for the effort I putting into the magazine," he said.

Friday was a full day of technical presentations, including "A Protocol for Multicast Weather Data Distribution over AX25," by Nick Luther, K9NL; "SuitSat-2 Update," by Steve Bible, N7HPR; "EcomScs and GateWayScs AX25 Packet Radio E-Mail," by John Blowsky, KB2SCS, and "Frequency and Other New Initiatives in APRS," by Bob Bruninga, WB4APR. The last presentation of the afternoon was "D-STAR Uncovered," by Peter Loveall, AE5PL.

The DCC provided a separate demonstration room for participants to bring and show off their latest projects. Participants were encouraged to bring their own equipment and display for all to see and learn. Wolfgang said he had some "play time" in this room after all the presentations on Friday. After dinner that evening, he said there was "a string of D-STAR presentations starting at 7 PM and lasting until after 10 PM. These were all very interesting presentations, including the D-RATS messaging software by Dan Smith, KK7DS.

Peter Loveall, AE5PL, presented "D-PRS Update" about ways the D-STAR data links can be used to send and plot APRS position maps or interface to the APRS system. Robin Cutshaw, AA4RC, gave a presentation about DV-Dongle, a PC add-on that allows connection to D-STAR repeaters around the world through your PC and an Internet connection. Pretty interesting!"

In addition to the main technical presentations on Saturday, there was also a full day of introductory sessions, mostly about digital voice and D-STAR.

Also on Saturday, Matt Etttus, N2MJI, gave a report on the Ettus Research USRP2. Tom Clark, K3IO, gave an "AMSAT Update." Paul Wiedemeier, KE5LKY, presented his paper on "Using UDPcast to IP Multicast Data over Packet Radio." Paul Rinaldo, W4RI, gave his "SDR Outlook" that covered the international regulatory front and presented some of the concerns that some world governments have with regard to the flexibility of SDR. Scott Cowling, WA2DFI, gave an "HPSDR (High Performance Software Defined Radio) Update" during which he described the various circuit boards that make up the HPSDR project. He also demonstrated a complete working radio in the demo room. Jerry Shirar, N9XR, presented a paper called "Clocking the Data," concerning the use of an inverter and a crystal to form a Colpitts oscillator.

Victor Poor, W5SMM, gave an update on Winlink 2000. "He reported that there is one Web site, five Common Message Server sites around the world, 150 Radio Message Service Pactor Gateway sites, 800 RMS Packet Gateway sites and over 13,000 registered users," Wolfgang said. "He also mentioned that inactive users are purged from the system from time to time."

Rick Muething, KN6KB, described his "WINMOR Soundcard ARQ Mode for Winlink HF Digital Messaging." Wolfgang said that this was a much anticipated presentation: "Rick reported that WINMOR is 3 to 4 months from beta testing. His preliminary comparisons to Pactor 1, 2 and 3 use a simulator. He indicates that WINMOR will have better throughput than Pactor 1 and comparable to, or perhaps a bit better than Pactor 2, but not quite as good as Pactor 3. He indicated that the efficiency is within about 70 percent of Pactor ARQ."

The TAPR Annual Meeting was held after all the presentations on Saturday where the Board of Directors discussed the idea of coming back to the same hotel for next year's DCC. "The local group that supported DCC this year, including Mark Thompson, WB9QZB, and Kermit Carlson, W9XA, did a great job of providing AV support," Wolfgang said. "Ron Steinberg, K9IKZ, who owns a local audio/visual company, provided two large projection screens and projectors, so every presentation was shown on both sides of the room, as well as on a widescreen TV outside the room. The audio was very easy to hear, even if you were in the hall outside the room or in the demonstration room; the set-up was left there from the W9DXCC Convention the previous weekend. They offered to provide the same support for next year, if the DCC returned. So, the decision was made to break with tradition, and return to Chicago next year, September 25-27."

Phil Harman, VK6APH, presented the Sunday morning seminar, "Software Defined Radio Through the Looking Glass." Wolfgang said he found Harman's presentation to be understandable "at my level of knowledge, and he gave a lot of good insight into many of the design decisions that went into the High Performance Software Defined Radio Project. I found his descriptions of how the hardware and software work to be very interesting. The four hours went by quickly."

For more information on the 2008 Digital Communications Conference, please visit TAPR's DCC Web page.

From: Glenn Currie
Topic: 1311 Message: 1313

There is limited room, but yes, OpenWrt makes use of a
file system to allow for firmware functions to be added as
modules, rather than redoing one big monolithic piece of
firmware. This helps reduce debugging of new features.
In windows these modules are .dll files - dynamically linked
libraries. Of course this concept was used long before
Microsoft existed.

There is information on the web regarding how to add a
compact flash drive to the 54GL. This allows much greater
room for a file system, as only the more basic boot information
must remain in the internal flash memory soldered on the
board.

So yes there is room for a small file system in the WRT54GL.
See www.openwrt.org

From: Steve
Topic: 1314 Message: 1314

Speaking of router deals. Has anyone noticed and or messed with the Fonera ones?

Apparently these can be had for $5-30 and they are Atheros based. (I.E. Capable of 2317-2732 MHz, with selectable channel widths, etc.)

The dd-wrt page shows support for them. Beyond that I don't know much about them, but am intrigued.

The Richardson Wireless Klub is setting up a ham radio station in Cottonwood Park in Richardson for Scouts and their parents to visit. Scouts will have an opportunity to communicate with other Scouts around the world by voice and/or morse code. It?s to be a hands-on exercise to expose Scouts to amateur radio and to demonstrate how ham radio can be used in an emergency situation.

DATE: Sat., Oct. 18, 2008 TIME: 9:00am ? 3:00pm
LOCATION: Cottonwood Park, 1400 West Beltline, Richardson

Please come by the park and help us show ham radio to the Scouts. Or give us a call on the repeater 147.12.

1317. Fall CQ-VHF piece

Yahoo group: DAWG-HSMM
Date: 2008-11-13 07:35:39 UTC
From: Steve
Topic: 1317 Message: 1317

I guess I subscribed in time to get this issue. I found the piece on mesh networking interesting. It's something I haven't messed with yet.

Here are some other Aerocomm tid-bits for anyone interested. (I'm not sure if Jeff King is on this list? He seemed interested in these things)

We put some attenuators in line with our Aerocomm TCPIP link to try and simulate the worst sustainable link. It's hard so say what out exact signal quality was as our hacked multi-meter RSSI idea jumps around a lot, but the it appears the worst data throughput is 800 baud, any worse and you likely don't have a link at all.

By the way we hex-hacked our units to hop only 902-915 MHz. We are doing a 900 analog repeater at the same site. There is no noticeable analog signal degradation as the receiver is 927 MHz. And there is no noticable throughput drop when the analog 902 MHz analog carrier comes up.. You can watch these units hop around that carrier just like you read about and expect FHSS to work.

Thanks to Bill for pointing out the Ubiquiti Nanostations, We picked a couple of these up. We replaced a 2 mile 2.4 GHz path with these. The link again is at modest heights 35 feet and 50 feet, inner city. It's been semi-marginal at times before due to co-channel devices. The S/N ratios appear much better now s this took the lengthy coax loss out of the equation. We are also now using a 5 MHz channel just below 2400 MHz. One negative seems to be the usable S/N ratio of these units compared to a Linksys WRT54G. It takes a couple db or more over what worked with the Linksys.

By the way there is now a NanoStation Loco with a $49 MSRP. It also is supported by a Linux SDK to encourage open source development. It's also a little less powerful, only 20 dBm (100 mW) instead of 26. (400 mW), and lacks the external RP-SMA.. Keep in mind after market firmware hacks let you do nearly one watt with the normal NS2, so this is likely a low ended report of what is actually capable of.

http://www.dailywireless.org/2008/10/28/ubiquiti-announces-tiny-wi-fi-cpe/

(If anyone has any CQ-VHF issues they are willing to part with, it looks like our club library is missing a couple issues, specifically Summer and Fall of 03. Contact me off list if you can help)

Hello NTMS

Does anyone know of any digital or HSMM operation in the Fairview area on
2304 and 3456 MHz?

Thanks

Al W5LUA

Now all I have to do is figure out where Fairview is located. HI

It is highly unlikely there would be any regular HSMM activity down on 2304 MHz.
The lowest "normal" HSMM center frequency on that band would be 2412 MHz.
That is the center frequency for Channel 1 in the Part 15 802.11 Band Plan....
unless Al is also talking about UWB and that is 500 MHz wide bandwidth.
Kent Britain, WA5VJB, might know the situation there.

Using something Atheros chipset based, the lowest center channel is 2312 MHz. Even if you lock that 5 MHz wide, which you can do with that chipset, it's going to be spread over 2309.5-2314.5 MHz which dosen't ling up with the lower 2300-2310 MHz amateur allocation.

So really the lowest Atheros channel one can use is centered at 2394 MHz.

If you have other, low-speed D-Star radios in your emcomm
architecture, you may be interested in some of the work that the
open source Asterisk PBX-based rtp_Dir project has succeeded in building
a
plugin that allow an Asterisk PBX to bridge D-Star, Echolink, and
IRLP, and conventional analog systems with each other.

Here's a YahooGroup devoted to ham use of Asterisk:

Yeah, ouch. You can do the same with with a Linksys Mobile Broadband AP/Router (WRT54G3G) and a Verizon Air Card. For a lot cheaper!

I know someone who is doing just that- a mobile hot spot. And mobile 900 analog repeater tied to echolink over that internet connection and to the HF rig in the car along with VHF and UHF ports.

The vehicle would look like a porcupine, but thanks to those Larson low profile (salt shaker) antennas, it really doesn't.

1332. ubiquiti Challenge ($200k in prizes)

Ubiquiti Networks has a new product called the RouterStation:
http://www.ubnt.com/products/rs.php

For the low low cost of $70, you get a MIPS based single board computer that has 3 miniPCI card slots. Picture a router with support for 802.11b/g for local connectivity, 802.11a for one long distance communications, and third link for 3.4GHz communications. With some miniPCI cards supporting antenna diversity, one RouterStation could result in quite an antenna farm. ;)

This board comes with openWRT support.

It seems that Ubiquiti feels that configuration of openWRT routers could have a better web interface, so they have issued a challenge to the openWRT community. Information can be found here:
http://www.ubnt.com/challenge
First prize gets $160k, and four additional prizes get $10k each.

I'd be interested in knowing if anyone in Plano is working on this.

Howdy Steve,

Well, I'm interested now. I'm being paid to build an Asterisk installation (PBX in a flash), so I'm getting experience in it. I can probably get one in the new PARK repeater site. We've gotten the VHF and UHF repeaters moved in, and are working on getting the DSTAR & winlink radios in.

Have you seen this repeater controller? It's based on an Asterisk core. I'm interested in it for our analog repeaters, but it's pricey, somewhere around $1.2k.

Just did a quick one look up for a Digium 4-port FXO (2-wire) PCI card and found a price of $350. This is the price of the card alone; one still needs to furnish an appropriate motherboard to mount this on. Also need semipermanent storage media and other peripherals. Cost ?? Let's lood at the Radio Grid - $1200 for 4 ports (hopefully 4-wire or separate transmit and receive leads), integrated with operating software on a much smaller footprint PCB - just add IP plan and routing policies. Sounds pretty fair to me.

You have to remember, too, that often times the initial cost of a somewhat proprietary (hardware and PCB design) platform with low volume selling and low production rates is higher than a system integrated with off the shelf parts. Then again, figure in your cost of labor (spec'ing, buying, installing, testing parts) and installing and integrating with the operating software. At my labor rates (what my company sells my services for), I think I have exceeded the cost of $1200!

Your mileage will obviously vary.

Hi.
Yeah I have seen that NHRC product. Yeah its very pricey as it's a commercially marketed thing. But it goes to show, Asterisk and SIP obviously have a future to interlink radio.

You can build the same thing for a whole heck of a lot less. Just give it a bit of time with PBX in a Flash.

John,

I recommend that anyone interested in Asterisk, start with PBX in a Flash or the Digium AsteriskNOW, distributions.

These are ready to go CentOS Linux, Asterisk & FreePBX (GUI) bootable ISO installs. I have found that a logical place to start is using a hairpin FXO/FXS adaptor on ones homephone line as a starting place.

Once you have barrels of fun setting up IVR's and so forth, it's time to pick up the O'Riley Asterisk: The Future of Telephony book and get down to the command line and see what else you can do. There are tons of scripts to play with, make nerdvittles.com one of your bookmarks. If you have used Linux before then it will be no time before you should consider playing with non GUI version of Asterisk, and I recommend the Allstar CentOS Install Distribution. This version is custom tailored for two way radio systems using app_rpt modules.

John,

I will agree with Steve, I run two RF Gateway servers running the Allstar ACID system from that group and they run great.. These Asterisk servers have a lot to offer you must bring your imagination with you when creating these types of servers. Its a lot of fun. There is also another system with GUI interface called XIPAR you can find it at http://www.xelatec.com/xipar/. Go and sign up and learn more what it has to offer. I'll list a few here:

The Xelatec XIPAR project combines the Asterisk? VoIP PBX with radio interface software and hardware that provides the following for Amateur Radio stations and systems:
- A Full Function Multi-Site Linking Repeater Controller
- Touch Tone Command and Control
- Autopatch - Reverse and VOX Operation
- CTCSS Decode/Encode Functions
- Asterisk VoIP Private Branch Telephone Exchange
- Voice Mail and Announcements
- Contact Closure Telemetry and Announcements
- Non-Proprietary Software and Hardware
- Open Source Linux Operating System
- Remote Base PTT Dispatch Client Software for PC's
- A Fully Configurable and Programmable Communications Solution

1340. Re: [ntms-hsmm] Linksys WRT54G

Yahoo group: DAWG-HSMM
Date: 2009-01-08 19:51:52 UTC
From: Glenn Currie
Topic: 1339 Message: 1340

Jim,

Versions 1 - 5 run Linux and have twice the memory as later versions.
The later versions just have more refined,
lower power hardware, but I still use many version 1 - 4 units and they
work great.

Get your hands on an older version 1 - 4 WRT54G device, or the WRT54GL.
Quite an amazing little device.

In later versions (5 and on) they went to using VX Works instead of Linux and
were able to cut the memory in half - fine for most consumers, but bad for
experimenters.

For amateur radio use, the WRT54GL (L) for Linux is still sold, new, and is
the preferred version of the 54G for experimenting. I have many of them
and they work very well.

1343. City of Richardson Siren Test

Yahoo group: DAWG-HSMM
Date: 2009-01-26 21:47:36 UTC
From: Kilgore
Topic: 1343 Message: 1343

---Please forward this info to your club members---

The City of Richardson is resuming tests of it's outdoor warning sirens on the First Wednesday of each month at 12:00 noon. There are 22 sirens to be monitored. Siren map is attached. Or go to: http://www.cor.net/WorkArea/showcontent.aspx?id=8778

Ham radio operators are needed to monitor each siren for sound and rotation. Reporting will be done on the 147.12 Mhz repeater. If you will be in Richardson on the First Wednesday at noon, please volunteer to monitor one of the sirens. You do NOT need to be RACES authorized to participate.

Please contact Bud Walton K5HW at 972-783-4751 to let him know which siren you can monitor. On months where the first Monday occurs before the first Wednesday, check-in for siren assignments will be made on the first Monday AFTER a shortened Richardson RACES training net at 9:00pm on 147.12 Mhz.

If you would like to be placed on an Siren Test email reminder list, please send an email to Doug Kilgore KD5OUG <kd5oug@...>.

1344. Large Auction of Test Equipment for Hams

Yahoo group: DAWG-HSMM
Date: 2009-01-30 17:37:36 UTC
From: Kilgore
Topic: 1344 Message: 1344

---- Please give this message widest distribution! ----
Richardson Wireless Klub
Large Auction of Test Equipment

HP Oscilloscopes - Spectrum Analyzers - Network Analyzers
Vector Voltmeters - Frequency Counters

A large quantity of Hewlett Packard test equipment has been donated to the Richardson Wireless Klub by a former club member shutting down a consulting business.

RWK will be holding two auctions to dispose of the equipment.
1. Friday, Feb. 6 Auction closes at 9:00pm (For current RWK members only - You may join or renew membership for $15.)

2. Saturday, Feb. 7 Auction closes at 11:00am (Open to general public - RWK membership not required)

For details, go to http://k5rwk.org/auction.html

*Sale is As-Is-Where-Is basis. No Shipping. There are no guarantees. *
The equipment can be viewed prior to the auctions on Saturday, Jan.31 from 9:30 AM until 2:00 PM.
Only RWK members may place silent bids before Feb. 7.
Payment by cash or personal check - no credit cards.

Location: Public Storage, 500 East Arapaho, Richardson TX 75081
(facing railroad tracks -- Talk-in Frequency 147.12 Mhz)

A private viewing of equipment before the auctions can be arranged by appointment.

From: Mark Thompson
Topic: 1349 Message: 1349

The 2009?ARRL/TAPR DCC (Digital Communications Conference) will again be in Chicago on September 25 - 27.

More?information at www.tapr.org/dcc? Feel free to publish attached advertisement in your club newsletter.?

----- Forwarded Message ----
From: Gary kn4aq@...
Sent: Friday, February 6, 2009 8:34:33 AM
Subject: ARRL/TAPR 2008 DCC Video Set Now Available:

ARRL/TAPR 2008 DCC Video Set Now Available:

The ARRL and TAPR Digital Communications Conference? was a three-day conference held in late September near Chicago. It featured twenty-one presentations from hams on the leading edge of digital communication, including D-STAR, a variety of programs for packet, Winlink2000 and advanced Software Defined Radio.

ARVN:Amateur Radio//Video News captured every minute of the presentations on video,* and now offers them on six DVDs in high quality video and audio. You can order by credit card or PayPal at www.arvideonews.com.

The presentations are grouped on the six DVDs in as logical an order as possible (listed below). You can buy the DVDs individually ($15/ea,plus $3 shipping, $4 international).? Or get whole set for $75 (plus $3/$4 shipping). The complete set saves you $30 over buying them individually, after shipping cost.

Here's how the DVDs are laid out:

DVD 1: Packet

* Nick Luther K9NL ? Weather Data Distribution over AX.25. Thought 1200 bps packet is too slow for images? Nick makes it work.

* John Blowsky KB2SCS ? EcomSCS and GatewaySCS "real e-mail clients" for Packet Radio mail.
* Paul Wiedemeier KE5LKY ? UDPcast for IP Multicast over Packet Radio. Better data distribution to multiple stations.

* Eric Westgard NY9D ? It's the Network: Minnesota Packet/D-STAR Data Network. DVD 2: Software Defined Radio
* Matt Ettus N2MJI ? USRP2 Universal Software Radio Peripheral.
* Paul Rinaldo W4RI ? SDR Outlook. The regulatory environment for SDR.
* Scott Cowling WA2DFI ? HPSDR Update. How HPSDR, TAPR, and AMSAT work together to develop cutting? edge technology, and where things stand now.
* Jerry Shirar N9XR ? Clocking the Data. How crystals and the Pierce oscillator work to stabilize your digital project.
DVD 3: Winlink 2000, D-STAR, APRS

* Victor Poor W5SMM ? Winlink 2000 Update. A complete rebuild to better handle emergency communications.
* Rick Muething KN6KB ? WINMOR, a sound card mode for Winlink. Performance rivaling Pactor II and III; far less expensive.
* Bob Bruninga WB4APR ? APRS Initiatives Since 2004. There's lots more to APRS than position tracking, and Bob has big plans!
* Pete Loveall AE5PL ? D-STAR Uncovered. How D-STAR really works, from one of the K5TIT guys. DVD 4: AMSAT, Publishing

* Steven Bible N7HPR ? SuitSat 2 Update. SuitSat 1 was a rush project, literally "pushed out the door." SuitSat 2 will be a real satellite with serious capabilities.(It'll be pushed out the door, too.)

* Tom Clark K3IO ? AMSAT Eagle GEO. Tom's proposal for a geosynchronous Amateur Radio satellite.Hint: 1200 MHz is now practically DC.

* Larry Wolfgang WR1B ? Writing for QEX, QST. You've developed a great project. Now get paid to tell the world about it.? Here's how.
* Joe Lynch N6CL ? Writing for CQ, CQ VHF. A little bit lighter side of technical writing. DVD 5: Introductory Sessions

* Mel Whitten K0PFX ? HF Digital Voice. A good grounding in WinDRM, FDMDV and the AOR modem digital voice modes for HF.
* Mark Thompson WB9QZB ? D-STAR Voice and Data. Answers your questions on how to operate D-STAR.
* Pete Loveall ? DPRS. Pete wrote DPRS to better utilize the GPS and low-speed data functionality of the DV mode. ICOM makes direct use of it in the newer radios.
* Dan Smith KK7DS ? D-RATS. Dan wrote D-RATS to make D-STAR low-speed text chat multi-platform. Then he threw in the kitchen sink. DVD 6: Sunday Seminar

* Phil Harman VK6APH ? Software Radio "Through the Looking Glass."? This is the full morning presentation of how the HPSDR Mercury receiver was developed. Mercury places the A/D converter at the antenna (after only a band-pass filter). So everything is done in software. Phil says performance is as good or better than the high-end commercial analog receivers.
Again, you can order the DVDs individually, or get the whole set.? www.ARVideoNews.com?

73,
Gary KN4AQ
Producer

* The "D-STAR Night" presentations are not included. That content is similar to the 2008 Dayton Hamvention D-STAR Meetings?, avaialble on DVD from ARVN. Tom Clark's talk at the DCC Banquet is also not included.

Quote:
7.0 Conclusion
There is global interest in allocating portions of the spectrum
between 470 MHz and 862 MHz for broadband wireless services. In
recognition of the value this spectrum offers for WiMAX deployments,
the WiMAX Forum® is developing time division duplex and frequency
division duplex system profiles for this general band to address
market opportunities globally.

--
According to this
http://www.telsima.com/pic/pdf/download/Demo_Brief-50km.pdf Telsima
got 6.5 Mbps out of 3.7 MHz over 30 miles on 450 MHz.

As pointed out in prior messages Telsima has certified a WiMAX
platform for operation at 70 and 33 cm (specifically, 400-1000 MHz),
with selectable channel widths from 1.5 MHZ to 7 MHz:
http://www.telsima.com/index.php?i=84

John, Doug,

Same here. Been meaning to send an email but have been hammered
with work stuff since I got home. Thanks for lunch / dinner John.
The brisket was good. I always enjoy Texas BBQ. Each place has their
own cooking methods and sauce, so it always good, but also are variations
on a theme.

I have not had much time to discuss things with the local HSMM guys,
but I have posted my initial proposal for mesh node on ARBONET-4,
and a summary of the meeting.

If the pilots will allow it, mesh nodes on the chase planes would be great.
They have altitude limits, but up to a point, they would form an airborne
mesh relaying all camera signals to all the nodes they could link with. If
the planes are close enough to the balloon to link, they would act as a relay
between the balloon and the ground crews below the plane. This should
increase the footprint of mesh availability in that the signal would be available,
from 2 aircraft plus the balloon.

Doug, you and your crew have been out in the field with the HSMM gear and
made it work. I have read all the HSMM news and photos posted on the NTMS
site by N5OOM. There is a lot of good stuff there. I had a specific question
though, I believe you said you use DD-WRT firmware. There are several
excellent 3rd part firmware loads available. Are there any specific features
that the firmware you are using provides over the factory firmware?

A lot of basic home users of Wi-Fi users would not care, but if there are specific
features of the WRT54GL firmware you use, that you find handy, I would be
interested in hearing about them.

Let me answer.

The standard factory software assumes that you are connected to the
Internet by a wire, and that you can add other users from the WiFi port,
or the 4 LAN ports.

It does not let you route to the Internet over the WiFi connection.
That is the biggest problem.

The factory software will let you turn the Router into a dumb access
point, but then you can not route with it. and you can not hook to it
with a WiFi connection.

The third-party software lets you do both at the same time.

So if you have 4 routers A, B, C, D

A ---- B ---- C ---- D

And A can see B, but not C or D
B can see A and C but not D
C can see B and D but not A
And D can see C but not A or B

With the third-party firmware if A is the only one with Internet
connection, any PC talking to any of the routers A, B, C, or D with Wifi
or Wired can have Internet access. Also if desired, any PC can talk to
any other PC attached to any of the other routers.

The big advantage to DD-WRT is the web interface for configuration. Some of the others have a command line interface, so you have to have the manual next to you to know what you have to type in. While not real easy, DD-WRT is much easier.

It is also being supported, and new updates are released about once a year. Some of the third-party versions are no longer being supported. The DD-WRT also supports a number of different routers. Check the list before you buy.

I personally like the WRT54GL, it is the WRT54G Version 4. After version 4 they shrunk the SRAM and the FLASH in the device, which limits the amount of software you can load. (it also runs on 12V, other routers come in with 7.5, 5, or 3.3V which makes it more difficult for outdoor operations where everything else is 12V.)

In all cases the documentation could be better, but there is some on the DD-WRT website.

From: jbeadles@pobox.com
Topic: 1354 Message: 1358

The 3rd party firmwares usually provide for WDS (wireless distribution system) functionality.
This is the basic bridging functionality that lets us bridge these things while still being in AP
mode and beaconing a call sign ssid. Basically, it acts as an ethernet bridge between APs by
using a packet that includes 4 mac addresses (source, target, AP 1 and AP2), if I remember correctly.

Also, they generally provide for more fine control of the various packet parameters. I don't
have my text book, so I can't discuss them in detail, but let's see if I can say something that
makes sense.

As you know, data is transmitted in packets across the wireless link. It is more efficient to
send fewer, larger data packets than more, smaller packets because each packet has to
have header information which takes time to transmit, eating your bandwidth. However, for a
given amount of transmit power, the longer the radio bridge, the greater the likelihood that the
packet will be disrupted by ambient noise, and have to be retransmitted. The smaller the
packet, the greater the likelihood that it will be successfully transmitted between noise bursts,
and the shorter time to retransmit. For any given path length, there should be an optimum
value for the packet segmentation length.

Some of the firmwares will allow you to modify parameters like this, or possibly set a
"distance" value which sets that parameter for you. There are other wifi parameters that you
can do tricks with, as long as you have access to them.

Kipton,

Thanks for the information. We roll our own firmware based on Open-Wrt.
it is quite a chore and takes a lot of time. We focus on the WRT54GL as
well. I have some of the older versions and they work, but use more power.

We need the memory space
of the version 1 - 4. We have found that the power subsystem on the
WRT54GL is much more efficient and forgiving than previous models.
It seems to run OK on 3.5 - 20 VDC with no problems and pulls less
than 3 watts at whatever voltage it runs on. It is great for battery powered
situations.

I know there is a lot of good work
put into the various 3rd party firmware loads, I just don't have the time to
load and test them all, so your information is most helpful. With the nose
so close to the grind stone, it is easy to miss some of the good features
others have come up with. The WRT54GL is really a versatile device and
I am sure we still have not figured out everything it can do.

It is hard to find people that have put the gear to use in the field and
I value their experience and advice.

Thanks,

-Glenn

Let me answer.

The standard factory software assumes that you are connected to the Internet by a wire, and that you can add other users from the WiFi port, or the 4 LAN ports.

It does not let you route to the Internet over the WiFi connection. That is the biggest problem.

The factory software will let you turn the Router into a dumb access point, but then you can not route with it. and you can not hook to it with a WiFi connection.

The third-party software lets you do both at the same time.

So if you have 4 routers A, B, C, D

A ---- B ---- C ---- D

And A can see B, but not C or D
B can see A and C but not D
C can see B and D but not A
And D can see C but not A or B

With the third-party firmware if A is the only one with Internet connection, any PC talking to any of the routers A, B, C, or D with Wifi or Wired can have Internet access. Also if desired, any PC can talk to any other PC attached to any of the other routers.

The big advantage to DD-WRT is the web interface for configuration. Some of the others have a command line interface, so you have to have the manual next to you to know what you have to type in. While not real easy, DD-WRT is much easier.

It is also being supported, and new updates are released about once a year. Some of the third-party versions are no longer being supported. The DD-WRT also supports a number of different routers. Check the list before you buy.

I personally like the WRT54GL, it is the WRT54G Version 4. After version 4 they shrunk the SRAM and the FLASH in the device, which limits the amount of software you can load. (it also runs on 12V, other routers come in with 7.5, 5, or 3.3V which makes it more difficult for outdoor operations where everything else is 12V.)

In all cases the documentation could be better, but there is some on the DD-WRT website.

From: Glenn Currie
Topic: 1354 Message: 1360

John,

Again, thanks for the notes from the field experience. Most concise and useful and not in the manual. We are interested in any adjustments that can be made for longer distance links. Your explanation makes sense. I will share the info with the local HSMM folks.

These routers were designed to link in a house or a building. They expect large buildings to have lots of them to keep from having dead spots, so they are not looking to send RF anywhere near as far as we would like to, so the timing parameters are of great interest.

I have seen adjustments for RTS/CTS and Fragmentation Threshold on some gear and not others. Linksys and other vendors might have hardware that has the capability to have these parameters changed, they just do not bother to make it adjustable by the user.

Much of what is known about how wireless routers like the WRT54G and similar devices comes from working with GPL code released by the vendor, but if the vendor did not write code to provide access to all the hardware adjustments, it is not clear if additional adjustments can be made or not. There is no example of how to access some features, and the chip vendors only seem to provide such information to their larger customers.

Anyway, that is one reason I keep asking around about features offered by the 3rd party firmware suppliers - sometimes they have figured out how to access hardware features that are not inherently documented by the GPL code the vendor releases.

Keep up the HSMM work. It is most helpful to have some other hams that have done significant field work to trade notes with. There is so much that can be done with this gear, and only limited time to investigate it.

I talked to several people including KD5OUG about HSMM work. I will post out a few paragraphs of information we have collected, with the hopes it will be of help. There is a lot of stuff on the net about mods to the WRT54G. Even trying to sort through all the postings takes a lot of time, and the quality of the information can vary greatly.

Today I signed up to give a presentation on our ARES-MESH work at HamCom, so I will need to collect my stacks of notes, sort through them and build a presentation. We have some good stuff working, but it just opens our eyes to how much more we can do, so it is a work in progress.

Thanks for your help, long ago at Summerfest, when you took time to show me your Rootenna. I have a couple of them now.

jbeadles@... wrote: The 3rd party firmwares usually provide for WDS (wireless distribution system) functionality.
This is the basic bridging functionality that lets us bridge these things while still being in AP
mode and beaconing a call sign ssid. Basically, it acts as an ethernet bridge between APs by
using a packet that includes 4 mac addresses (source, target, AP 1 and AP2), if I remember correctly.

Also, they generally provide for more fine control of the various packet parameters. I don't
have my text book, so I can't discuss them in detail, but let's see if I can say something that
makes sense.

As you know, data is transmitted in packets across the wireless link. It is more efficient to
send fewer, larger data packets than more, smaller packets because each packet has to
have header information which takes time to transmit, eating your bandwidth. However, for a
given amount of transmit power, the longer the radio bridge, the greater the likelihood that the
packet will be disrupted by ambient noise, and have to be retransmitted. The smaller the
packet, the greater the likelihood that it will be successfully transmitted between noise bursts,
and the shorter time to retransmit. For any given path length, there should be an optimum
value for the packet segmentation length.

Some of the firmwares will allow you to modify parameters like this, or possibly set a
"distance" value which sets that parameter for you. There are other wifi parameters that you
can do tricks with, as long as you have access to them.

1361. Cornyn's new bill: retain those log files

Yahoo group: DAWG-HSMM

From: Robert Ellis
Topic: 1361 Message: 1361

Our very own Mr. Cornyn, has sponsored a new bill that may affect how you
treat your hsmm log files. (S.436)

"A provider of an electronic communication service or remote computing
service shall retain for a period of at least two years all records or other
information pertaining to the identity of a user of a temporarily assigned
network address the service assigns to that user."

I guess that this also affects dstar repeaters and wl2k gateways (not just
the wifi you use for non-ham purposes).

The bill might spur paper sales, as folks print off their log files with 132
lines per page.

robert

"provider of service" implies commercial provider -- is there a link to the bill available so we can better determine what the language means in this case ??

Tracking network addresses assigned is a waste of time on systems that employ a NAT gateway (most home wifi systems for instance). Without usage logs to go along with the address data, there is no way to trace any given activity back to a specific user.

So, this can only be effectively applied to systems that assign publicly routable IP addresses to end users, and to systems that have user authentication in the first place.

I do not think this applies to Part 97. It is for common carriers only.

SEC.5. Retention of Records By Electronic Service Providers.
Senate Bill S.436

Section 2703 of title 18, United States Code
<http://www.law.cornell.edu/usc-cgi/newurl?type=titlesect&title=18§ion=2703>,
is amended by adding at the end the
following:

?(h) Retention of Certain Records and Information- A provider of an
electronic
communication service or remote computing service shall retain for a
period of
at least two years all records or other information pertaining to the
identity of a
user of a temporarily assigned network address the service assigns to
that user.?.

(b) Definitions- As used in this section--

(1) the term ?Internet content hosting provider? means a service that--
(A) stores, through electromagnetic or other means, electronic data,
including the content of web pages, electronic mail, documents, images,
audio and video files, online discussion boards, and weblogs; and
(B) makes such data available via the Internet; and

(2) the term ?email service provider? means a person that--
(A) provides a service, using the Internet, for the transmission, receipt,
storage, and retrieval, by registered users, of electronic mail
messages; and
(B) receives the content of, and recipient list for, electronic mail
messages
that it transmits, receives, or stores for the person or entity
procuring such services.

http://www.govtrack.us/congress/billtext.xpd?bill=s111-436

If it attaches to the Internet it will be effected by enactment of
S.436, if you allow
someone to use your Wireless Internet Hotspot you will need to maintain
a record.

If one only has a Intranet established with no physical presence on the
public Internet
there will not a be a problem. At least as the Senate Bill is presented
currently.

The way it is set up it will apply to such things as WINLINK email
gateways, since
WINLINK has a gateway to the Internet.

Keep those network logs handy.

Mars

1365. Re: [ntms-hsmm] Cornyn's new bill: retain those log files

Yahoo group: DAWG-HSMM
Date: 2009-02-21 22:48:58 UTC
From: John Barrett
Topic: 1361 Message: 1365

1. Winlink does not assign IP addresses to the radio users connecting, therefore there is no information of the type described to log.

2. As a "hotspot operator" (I have a limited number of people that are allowed to use my AP), I can NOT assign them publicly routable IP addresses since both my hardline and wifi networks pass through a NAT router to reach the internet, therefore everyone shares a single IP address AS FAR AS ANYONE ON THE INTERNET IS ABLE TO TELL. Again there is no information of the type described to log.

3. I would hope that a DSTAR internet gateway would use NAT techniques as well -- cannot see the operator of a dstar repeater requesting a block of IP addresses from their service provider, such that the gateway could provide unique publicly routable IP to each connected user.

IMHO the language of the bill needs to be changed to reflect the technical impossibility of logging information which doesn't exist, so we don't run into officious busy bodies trying to enforce laws that cannot be enforced.

It's more of one those carte blanche bills that is so vague that it could be applied to just about anything. It mentions "temporarily assigned network addresses" so that goes into play with the NAT and how the bill sponsor plans for the recording of information is to be gathered and maintained.

If it attaches to the Internet, bureaucracy will find some way that it will need to be logged, even if it is NATed. Even the satellite based Internet providers that use private IP addresses between the NOC and the enduser will still have to find ways tag the user information if the proposal is made statutory. Definitely will not be a easy task for anyone.

OK -- I didnt read the whole thing -- but tell me -- an officer/agent comes to you and asks for info concerning a specific IP address -- you run nat with 100s of users -- the agent has ONLY the public address -- how does that identify the specific user ?? You can hand over the entire log but that doesnt tell the officer/agent anything useful.... And if you dont run a login based system, you dont know who got the IP address to begin with (my private AP for instance)

This is simply unenforceable for anything except commercial providers -- unless router firmware is drastically changed -- where is my bailout to finance this hardware change to meet the new requirements ??

From: Mars Reed
Topic: 1361 Message: 1368

The sad part about the way it is worded, it will place a very extreme burden on anyone that provides a service (be it a commercial, public or private service), if it touches the Internet some how the records will need to be kept. How they plan to enforce the record keeping isn't apparent, but I'm sure that there will be those that will use it as a means to take storage devices in the name of "investigation purposes."

The neighborhood hotspot may end up being a thing of the past. Talk about a statutory nightmare ahead when it comes to records documentation.

From: rddunnin@rockwellcollins.com
Topic: 1361 Message: 1369

From Atlas Shrugged by Ayn Rand:

"There's no way to rule innocent men. The only power any government has is the
power to crack down on criminals. Well, when there aren't enough criminals, one
makes them. One declares so many things to be a crime that it becomes impossible
for men to live without breaking laws. Who wants a nation of law-abiding citizens?
What's there in that for anyone? But just pass the kind of laws that can neither be
observed nor enforced nor objectively interpreted and you create a nation of
law-breakers"

Though I hold some metaphysical complaints against Rand and her followers I
have to admit that when she was right, she was right. This, is a quote that
illuminates the inherent danger in arbitrary, capricious, and unenforceable laws.
I take no comfort whatsoever in a law that is poorly written and unenforceable as
it is ripe for use as a bludgeon to be applied to those who find themselves cross-
wise with the powers that be.

RD

I've been wondering about this since I first heard of HSMM - in my mind I was imagining that I could access the internet while on the road, something like this:

laptop > AP/router > radio > antenna > repeater > internet gate > internet

Is this feasible in any way or am I misunderstanding HSMM?

--- In ntms-hsmm@yahoogroups.com, "Steve" <kb9mwr@...> wrote:

From: Bob Diepenbrock
Topic: 1330 Message: 1372

You got it about right.

Usually though the "radio" and "repeater" part are just standard AP/Router equipment with additional power and/or antenna gain.

I also don't think I'd say "repeater" exactly. What we are doing is more like a packet node which is not a repeater, but a separate send and receive operation.

So the picture is something like this:

```
Laptop >
  Off the Shelf 802.11(b-n) device >
     (Optional amp) >
        Antenna
          <--- RF Link --->
        Antenna >
     (Optional Amp) >
   Off the Shelf 802.11(b-n) device >
Internet connection
```

One more thing to keep in mind. The HSMM link is for licensed users only so you will need to protect the link from unlicensed users. However, you will need to make a note in your logs or some other record if you set a WEP key on the link if the FCC comes to ask you for it.

Another thing to watch out for is the content that goes over the link. There are some restrictions to keep in mind, such as not receiving business E-mail and such.

Please define what you mean by "on the road".

I made a summer vacation trip from Texas to Alaska and used 802.11 in RV parks and hotel lobbies. You can go to Starbucks, McDonalds and city libraries to get access. It's all over the place. Some places may charge for internet access but you can find free access if you look for it.

But you have to be stationary to use them. I did use a Linksys WRT54gl mounted in a Pacific Wireless Rootenna to reach out and connect to the RV office some distance away line-of-sight. But I don't consider that as being HSMM because I used off-the-shelf components available to the public under Part 15 power.

I also have a Sprint Broadband USB card that will allow me to literally have internet access while moving. Just plug it into the laptop and go. Works where ever you can get a cellphone signal.

Is this what you are thinking about?

Unfortunately, yes, I was imagining some sort of long-range connection while moving. Storm-chasing, specifically. I guess if every county had a repeater with HSMM set up it might work, but I probably shouldn't hold my breath on that one.

Still, I like a lot of the ideas I'm reading here. Lots of geeky goodness to play with.

Let me take a second to clarify, that the HSMM banner covers any technology that provides over a certain data rate. That includes things like retasked Wifi, WiMAX, DSTAR, experimental ODFM radios, etc.

At this time, the only thing I'm aware of that's really suitable for county wide coverage is 1.2GHz DSTAR data. Unfortunately, DSTAR data has coverage issues, and can't be counted on for mobile data. Wifi isn't really particularly suitable for county coverage, though WiMAX might be.

I have spent hours on the FCC site, and have not been able to find a band suitable for the XR1 in the US. Hopefully Ubiquity knows something we don't, but it does not look to promising.

Hey Guys,

This card is mainly for OEM licnesed applications, and would not be legal for the general public in the US.

Thanks,

Mike

Yeah I saw that... Designed for Metering Applications

The reason I pointed it out is because this is the lowest frequency I have seen them design a 802.11 radio for yet.

Really makes you wonder when one of them will cover 420-450 MHz as a side benefit.

I wonder if it would fit in the Part 97 rules for use on 2mtrs....

420-450 would be better for my ideas....but could make it work on 2mtrs if it fits the rules and
regs.....

The XR1 would fit into the 1.25m frequency wise. Getting the 1.25m band plan to allow for OFDM, sure would open up some interesting possibilities.

Would tend have some problems with the size of the channel too, considering the minimum channel size is 5MHz.

Mars,

This is an interesting product with lots of possibilities. Years ago, I was on the ARRL special committee, chaired by Todd Olson, K0TO that successfully proposed the 219 MHz allocation that we have and sadly don't use.

These frequencies provide excellent path possibilities and so I have a couple of questions:

Is the power level of this device such that it could be a Part 15 device?

Could the transmission envelope be modified to be narrower and provide a lower throughput, but then comply with the bandwidth limitations of the 1.25 cm band?

Thanks & 73,

Gordon Beattie, W2TTT

The XR1 is spec out at:

22 dBm (158mW) 54Mbps
28 dBm (630mW) 6 - 24 Mbps

OFDM

==========

As for the transmission envelope, that would be a good question for the guys at Ubiquiti Networks (just sent a note to them, will let the group know what I find out).

Note: the XR-1 operates 180-280 MHz thus the closest Amateur Radio band is 1.25m

..I see nowhere the listing that shows FCC approval for Part 15 or otherwise??? Is this even legal in the US? Most of these companies sell "stuff" as either "OEM", "HAM" or "EXPORT" equipment and it is widely used in the US illegally! Just listen to the 900 band lately! 4W EIRP??.....yea right! I know for a fact most of these guys are running between 40-100W ERP and nobody cares. Believe it or not, Hams have even been sued for interfering with Part 15 users! Not supposed to be possible...but it's happening! Someone needs to keep an eye on these people.

Keep in mind that the channel may be 5-MHz but...
the signal bandwidth can be as high as 25-MHz!

Even on 2.4-GHz we have channel overlap.

Already aware of the channel bandwidth size, as in the XR1 specs it references that channel size can be set. Even with the minimum channel size it wouldn't fit into 222MHz band, but there may be ways to reduce the overall spectrum requirements.

Be nice if the full 219 to 225 MHz was available.

=====

All the bands above 2m have some overlap, and then there's additional services in the same allocations.

Per Ubiquiti Networks Support Team:

This card does not have these capabilities and is not legal for sale in the US.

========

Questions Asked:

1. Could the transmission envelope be modified to be narrower channel?

2. If the channel size is reduced, how much of a reduction in overall speed would occur?

Ubiquiti are based on the Atheros chipset. In 802.11g mode you can select the 5 MHz channel width. On a solid path this can still yield up to a 10 Mbps signaling rate.

In my opinion the madwifi guys should consider 2.5 MHz channel width support. That can still yield a very usable speed. As we have seen, the Wimax stuff supports channel widths down as low as 1.5 MHz

1389. HSMM???

We are in the process of installing HSMM links between the
local Red Cross chapter office where we have a radio shack
and the City of Austin and Travis County EOC, where we have
another radio shack and additional computer servers supporting
digital communications.

Point to point links of 10 miles or more are relatively straightforward,
if you can get Line of Sight sites.

Go for it. It is the wave of the future.

See if you can get a "static IP address" for you HSMM node at the
EOC. We are working on that. That gives you a straightforward
way to link your HSMM system into the Internet when needed.

Let me know if you have any questions.

I am on my way to Kerrville to give a HSMM presentation this
evening.

1394. DD-WRT for HSMM Workshop

Yahoo group: DAWG-HSMM
Date: 2009-05-23 22:41:16 UTC
From: Kipton Moravec
Topic: 1394 Message: 1394

I am thinking of having a workshop on using DD-WRT for HSMM.

I would cover what we have done for HSMM for Richardson Wild Flower Festival Wild Ride Bicycle Rally, and the Plano Balloon Festival.

Show different examples of adding antennas to routers.

Show how to load DD-WRT in to a router.

Show how I configure DD-WRT. And what some of the the settings do.

The workshop part is to let you bring your router, have a show and tell, load DD-WRT (if you have not done so yet) and set up routers outside and let them communicate with each other. So far the biggest network I have built is 4 routers with 3 hops. I would like to demonstrate 10 hops or so.

I am looking at August 15 or 22 in Lucas Texas (Lucas is just east of Allen). I am limiting it to Amateur Radio operators only. And I do not have physical room for more than 25 people. Is this of interest to anyone on this list?

Kip

I would support more hams making use of 3rd party firmware for ham radio use of low cost Wi-Fi gear. The DD-WRT firmware is good stuff.

In the Austin HSMM SIG we use Open-WRT as a base and are on our 3rd version of heavily customized ham radio variant of this firmware base. We find the structure of the Open-Wrt firmware lends itself to the source code modifications we are adding.

We have our reasons for using the Open-Wrt firmware base. Other 3rd party firmware bases have many advantages over the original Linksys firmware.

The number of useful modifications that can be made are almost endless, depending on what features you wish to add and how much memory you end up having in the hardware.

We found adding the Optimum Link State Routing (OLSR) firmware easier to add t the Open-WRT base. Other peripherals are being added using I2C code and "stolen" LED general purpose output lines.

There are not enough hours in the day to check out all the great ham mods that can be made to these inexpensive routers.

I would strongly encourage helping others get started with HSMM in any way possible. The more people we can get using this stuff, the greater the knowledge Base and ham related mods that can be developed.

If all goes well, I will give a presentation at Hamcom on our ARES-MESH auto linking auto healing mesh firmware for the several models fo the Linksys WRT54G.

We need more hams workng with this gear. It is relatively inepensive and gives us a way to do provide broadband amaateur radio communications alternatives.

Regards,

-Glenn

For us, the DD-WRT works fine. However I would like to investigate
Open-WRT as there may be trouble in the future for DD-WRT users.

http://www.bitsum.com/about-ddwrt.htm

It has not affected us so far with what we are doing, but I am concerned
for future releases. It reminds me of RedHat.

The best part of DD-WRT is the GUI interface for setting everything up.
Open-WRT (I have read) is mostly command line based, which makes me
concerned it is not as easy to quickly get it going. Which is what you
want in an emergency.

It looks like there are other groups making a GUI front end to OpenWRT
like X-WRT.

http://en.wikipedia.org/wiki/X-Wrt

Again, I have not played with it yet.

I look forward to your presentation at HAMCOM. I will be collecting
money from the parking lot vendors early Friday morning, then I will be
helping with the Audio Visual part of the seminars, making sure
everything stays working.

It is too late to get into HAMCOM this year, and I probably will not be ready. I am still working on the presentation. I hope to have something next year at HAMCOM.

Kip and John,

Dallas is a long way from New Jersey!

:-)

Materials and an preparation outline would be of great interest here.

Several of us are interested in this topic for EMCOM and technology reasons.

Thanks & 73,

Gordon Beattie, W2TTT

All,

Do what you can to help get HSMM information into the ham community.

We have done quite a bit of HSMM work here in the Austin TX area, and we had to make a variety of choices. Some worked out and some we had to go back and change.

Just looking through the different 3 party firmware releases for these very capable consumer Wi-Fi wireless routers is overwhelming even for a avid readier and firmware writer like myself.

The variant of HSMM making use of the inexpensive consumer wireless routers, is a tremendously important topic and we need to get as many hams as possible interested in it.

Microwave and computer networking is not every ham's "cup of tea", but we need to help other hams understand that the rest of the world makes massive use of the type of communications supported by these Wi-Fi routers and we need to be ready to help served agencies that make massive use of this type of radio communications.

If there is some material that could be slipped into one of John's HSMM slots, I would encourage giving it a shot.

I am still struggling with my ARES-MESH presentation in that there is so much to cover, I could easily talk for a weeks worth of presentations, if my voice would hold out. I am also not an ace at making power point type slides - it takes me quite a bit of time to make a reasonable set of slides.

(I know some Power Point experts that knock out presentations over night - I am not one of them!)

The whole field of computer networking, via wires / fiber optics, is huge, add the RF variant and you have even more material to cover.

I took a quick look at the DD-WRT firmware website (I am more familiar with Open-WRT) and it is clear that the different firmware releases all have a wide variety of useful features.

I have spent many hours working with the Open-WRT development system and it is a huge effort to dig into - after coming home from working on a computer programming all day (not a good way to stay a balanced person ;-) We need more developers!

What I take away from the past few years is that I consider hams getting into HSMM in a big way, is essential. As I said, not all hams are going to want to get into it, but not to be up on one of the most pervasive uses of radio - in our own

bands - for cheap - is something we can't let pass us by.

The task is very large so the sooner we can start getting more info out to hams the better.

The variant of firmware that the Austin HSMM SIG has developed makes use of Open-WRT firmware as this was the shortest path to implementing Optimum Link State Routing (OLSR). Emergency situation configuration is a real problem so we burn the users call sign into the flash memory as part of the firmware update process. Each mesh node has a unique address (due to a type of hasing function we make use of).

There is no software configuration in the field, unless you are one of the half a dozen developers that ever does that sort of thing. You simply turn the unit on and all mesh nodes within RF range will automatically link in about 30 seconds after power on. With a working network up, you can also pre assign resources like cameras servers etc.

Most users never do this. They simply turn on their Linksys WRT54GL with ARES-MESH firmware and go to book marked places in their web browsers - this is where the cameras and web servers have been book marked.

If a link goes down, if there is an alternate path available in the collection of mesh nodes, the route is changed automatically with no user intervention. They would have to be watching a network monitor to know anything changed.

The main challenge is to simply try to have enough mesh nodes in a particular area so there are always multiple paths to anywhere you wish to reach.

ARES-MESH can operate completely independently of the Internet, or it can be connected to the Internet.

If you plug in a live Internet connection into the WAN port on the back of any of the live mesh nodes, all other nodes in the area are on the net in under 30 seconds with no user intervention - except someone plugged in the Internet link. (What about plugging in more than one Internet link into a live mesh - we are still busy! - for now keep the system admin informed before plugging in more Internet connection! We hope to split the load smartly but that is for a future version of the firmware.)

We are rolling out ARES-MESH in the Austin AREA. My health problems have caused delays, but I am moving as fast as I can.

With all that I have done with the HSMM stuff in the past few years, it gives me a perspective on how much we still need to do and how much more there is to learn about this technology to make the most of it.

Getting folks going with DD-WRT and on the air is something I would encourage. With all the effort I have put into my HSMM work - Kip is right about the importance of having a nice GUI for users to use and learn with. We put some in our 3rd firmware release based on Open-WRT due to user feedback - but there is limited memory in the routers and the graphics takes precious bytes.

While helping take a tower down today, it came to me that it would be most helpful to show hams how to load alternate firmware into a wireless router and get it on the air. DD-WRT has a nice GUI so it is a good place to start and there are people on this list that have experience with it.

You can get to a command line in any of the firmware releases I am aware of - the GUI is built on top of it - but save that for later. Setting up a working HSMM link, getting experience with the antennas and the magic of spread spectrum is all very important stuff to know and it can be put to use quickly.

Each large project like compressed video, VoIP etc, are all VERY large topics in themselves. We need to get some "hands on" demos going on. We do what we can to support hams in the Austin area, but one of my biggest concerns is not being able to support hams in other places, after I give my Hamcom presentation.

So due to the input from this mailing list, I am going to make a focused effort to get a program going to show hams how to load some good 3rd party firmware, set channels, set SSID, and pass some data. Get on the air and learn about some of the other stuff later!

The OLSR auto link work we have done can be real useful in a lot of applications, but it is just one of an almost endless number of things hams can do with HSMM.

Whatever else we do, a basic firmware load, configuration and passing data class / demo is something we just have to get well documented and widely available in ham circles.

Enough for now. Thanks for the discussion and ideas.

1405. plano gov't wifi mesh

Yahoo group: DAWG-HSMM
Date: 2009-06-14 12:19:26 UTC
From: Robert Ellis
Topic: 1405 Message: 1405

I attended the hamcom sessions on hsmm and found them to be very informative. I particularly liked the demonstration at the end of the session in which a mesh node to which a $19.95 webcam was walked from the session room to the flea market area, passing by several other mesh nodes, and maintained a video image to the wifi hardware in the session room.

While there, I heard someone behind me chatting about the public service mesh wifi hardware that Plano is using to support its police cars. I was a little curious about that, so poked around on the internet. Others in Plano might be interested in what Plano is using.

- Plano has spent $8m (to Motorola for its Quattro wireless mesh hardware), and $21m for its Technical Services Department which includes equipment for its Public Service Wireless Mesh Network, including installation and maintenance.
(http://pdf.plano.gov/agendas/ccminutes/cm121906.pdf
)
- information on Motorola's Quattro motomesh:
http://www.motorola.com/statichtml/MOTOMESH_Quattro.html
. (This is a four radio system that uses licensed 4.9GHz radios, as well as unlicensed 2.4GHz radios. You'll be pleased to know that Wifi connections to the police vehicles is good up to 150mph.)
- here's a nice Motorola article that talks, in general, a little about mesh network, and provides some pretty pictures: http://tinyurl.com/mvbymr
- here's another Motorola article that talks about reliability and using the unlicensed spectrum. http://tinyurl.com/nxxm5w
- a Motorola article on using gps synchronization to reduce interference when multiple radios are used on one mast: http://tinyurl.com/l33x7g

(no, I don't work for Motorola)

Seeing all that Motorola has put into the Quattro system, and the prices that it charges, kind of makes me wonder what kind of MOU was reached between the Austin amateurs and the Austin hospitals and other Austin public service entities, with respect to reliability and quality of service. ;)

Good to hear from you.
I am glad you enjoyed the presentation.

The technology the Austin HSMM SIG has developed is good and getting better.

I am sad to see people with huge marketing budgets selling mesh and related gear at super high prices - and it works, sometimes an not others. We have limited resources, but will eventually have so many nodes that we will have good coverage in many areas of Austin, using very low priced gear.

Thanks for the pointers. I will check into them and continue to educate myself on this rapidly changing field - both the pros and cons! of what is happening!

Thanks,

-Glenn

2438.0-2450.0 WB FM, FSTV, FMTV, SS experimental

Note: The 2300 MHz band plan was adopted by the ARRL Board of Directors in January 1991

==========
It does not look like Texas has a different band plan than ARRL in these frequencies. Like they do in other bands.
==========

So now we have the data. Here are the questions:

According to the ARRL Band Plan, our WiFi equipment operates in the Satellite, Satellite High Data Rate, and WB FM, FSTV, FMTV, SS experimental parts of the ARRL band plan. Does anyone see a problem with this?

The other problem is that WiFi uses 22MHz of bandwidth and "High-rate data" is 4 or 5 MHz wide. There are no places in the band plan for a 22 MHz wide signal.

I could say a lot on this subject. But I can't speak any area other than where I live.

To be a "good ham." I've used a down converter to monitor 2.4 GHz for any traditional amateur use.

I also devised a few automatic ways to survey other bands such as 70cm for usage statistics.

A few years back I helped launch two 900 MHz repeaters that utilize 25 MHz splits. I made the grand mistake of trying to help get them coordinated mainly for advertising purposes, as there is very little activity in my state above 900 MHz.

The state coordination body didn't recognize anything other than the 12 MHz splits. And this whole ordeal really woke me up and irritated me about our bandplans. I have ever since had a horrible attitude about it all :-)

One of the purposes of a frequency coordinator is to recommend standard operating procedures. The frequency coordinator's main job is to make sure your repeater will not interfere with nearby repeaters already established.

They have the duty to not only produce bandplans that satisfy the needs of repeater owners within its area but also to protect the interests of coordinated systems in adjacent areas, weak signal modes, digital communications, AM and FM simplex, and satellite uplinks and downlinks. They define the bandplan for both coordinated and non-coordinated activities within its territory.

In the event your coordination body's band plan is behind the times; Aside from the FCC's frequency limits spelled out in Part 97, everything else is technically a voluntary band plan. If you decide not to comply with the voluntary plan, you should have good reason to do so, and should try your best not interfere with others.

Interestingly enough about 10 years ago there was an ARRL Request for Declaratory Ruling to the FCC.

"Amateur operators should be familiar with, and should abide by, the voluntary band plans that are applicable to the frequency bands in which they operate; and (2) due to the widespread acceptance of those band plans, any amateur who selects a station transmitting frequency not in harmony with those plans is not operating in accord with good amateur practice."

That request really sets me off as I do not agree with it's wording. I view that a overbearing, detrimental notion.

Good amateur practice to me is what I described. Make your best effort to check for other band use, like I try to do.

And if you determine the conventional band use doesn't offset your experimentation, then I tend to think what you are doing on our underutilized SHF bands IS in the best interest of the amateur radio service.

From what I have observed, the frequency coordinator's job (at state, regional and nation levels) isn't an on-the-air practice so it seems they are totally off the hook when it comes to holding up their duties.

Now with that off my chest I understand there is some ARRL Microwave Band Planning in it's initial stages that I welcome as it's long overdue in my opinion. So I do look forward to reading other peoples thoughts on how to tackle the problem of promoting ultra wide band data modes and somehow keeping some harmony with any existing activity on these bands.

Many thanks for your remarks and experiences.

We live in changing times. Everyone understands that without some sort of coordination super valuable RF communications can quickly turn into an unusable mess.

Band plans do need to be updated at times, and to do a good job, we need to help coordinators know what is out there to be coordinated.

HSMM is new on the block and we need to let people know we are developing new modes, and want to play well with everyone, but need some bandwidth we can use with our inexpensive equipment.

Not an easy job, but people need good info to make good decisions so a number of us are doing what we can to let hams know what we are doing and what potential changes could help foster the new HSMM modes.

By FCC enforcement and the ARRL, following the band plan is 'good operating practice'....

You can use the gear under part 15 rules that states you can not interfere with licensed operators. If it does not interfere under part 15 rules, I see no reason you can not use it at
those same power levels under part 97 rules....no, it is not following the letter of part 97 rules,
but I think it follows the intent of cutting interference between modes.

There are a lot of modes that are protected by the band plans that are not active at all in my
area. Due to terrain, there is no way that other uses here would hurt those in other areas. Yet, by the letter of part 97 rules, I should not use other modes in those band segments.

The band plans need to be updated far more often than they are now to better use the RF spectrum we have.

Just my thoughts.....flame suit on.....

We live in a changing world.

It could be helpful for HSMM to have some band plan changes.
Let's think this through on what would make sense and negatively impact
the least number of uses and think about amending the band plan to help
support HSMM.

This needs a lot of thought and input. It is real easy for hams to ask the FCC
to make changes that end up making no sense - much less our own
"gentlemens" agreement band plans that the FCC lets us work out.

Keep the ideas coming.

-Glenn

By FCC enforcement and the ARRL, following the band plan is 'good operating practice'... .

You can use the gear under part 15 rules that states you can not interfere with licensed

operators. If it does not interfere under part 15 rules, I see no reason you can not use it at

those same power levels under part 97 rules....no, it is not following the letter of part 97 rules,

but I think it follows the intent of cutting interference between modes.

There are a lot of modes that are protected by the band plans that are not active at all in my

area. Due to terrain, there is no way that other uses here would hurt those in other areas.

Yet, by the letter of part 97 rules, I should not use other modes in those band segments.

The band plans need to be updated far more often than they are now to better use the RF

spectrum we have.

Kip,

Please keep in mind that the ARRL Band Plan was written almost a decade before 802.11 came into wide use. Also, recall that the ARRL Band Plan is only a recommendation. Local frequency coordination is decided by the Repeater Councils, most commonly for frequency pairs, but often for simplex channel use too.

I suggest that for all practical purposes you simply ignore the ARRL 2.4 GHz band plan, and focus more attention on coordinating with your local repeater council. That is exactly what they do too, anyway! (HI)

Hi John,

I haven't done anything on 6 meters since the STA expired. I've been making a less expensive version of the DCP-1 hardware that is more flexible. The external microcontroller has been replaced by a soft CPU inside the FPGA. The winter TAPR newsletter has an article on this CPU and the source code is on the TAPR web site. I've ported all of the Verilog code developed during HSMM working group era to the new FPGA and a later version of the Xilinx develoment tools. The modules that were tied together in hardware are now peripherals for the soft CPU and several more have been added to support traditional analog modes. I've attached a block diagram and some pictures of the new PCBs. I plan to pulish more on the PCB and the rest of the Verilog and assembly language code as testing progresses.

This new board can generate and process 1-30 MHz RF directly. I'm now testing soft CPU code for the various modes and have SSB and ISB transmission and reception working plus FM and OFDM transmission. I should have FM and OFDM reception working soon. The soft CPU scheme allows the DCP-3 hardware to be easily switched between analog and digital modes so it can be used to build a general-purpose radio or fed into a transverter. The final configuration is intended to be a device that will switch between analog voice and TCP/IP data via the ethernet port.

I plan to do more on-the-air testing this summer. The new Verilog tuner and modem modules can handle signal bandwidths between 1.6 MHz and 500 Hz, so I'm no longer restricted to VHF and UHF. I may do initial testing on 80 meters with 6 kHz wide OFDM that could support 9.6 kbps under good conditions. Anything that will work on HF will work even better on VHF and UHF frequencies. Switching to 750 kHz wide 1.2 Mbps signals is now a matter of loading new filter coefficients from flash memory.

After testing on 80 m and 70 cm, I could apply for renewal of the STA for wideband 6-meter tests. However, it's probably more useful to find few other stations that could test on 80 m or 70 cm first. I had to use up 120 square inches of 4-layer PCB to get a prototype, so I made four DCP-3 PCBs and two other variations. One simple route to more widespread testing may be to produce a few adapters for transverters with 28 MHz IFs. I'll see what happens in the fall after I've done more on-air testing myself.

Since the DCP-3 is easily programmable there is another alternative for the 6-meter bands that is currenlty legal and could be developed. OFDM is limited to AM voice bandwidth on the VHF bands. However, 8PSK could fit in the same 20 kHz bandwidth as 9600 bps FSK and could operate at 3 times the data rate. I did put AX.25 accelerator logic in the FPGA, but it will be a while before I have time to test it on anything but the logic simulator. It's intended be used to implement 9.6-76.8 kbps FSK modems for amateur satellites which is what originally got me interested in doing a DSP project.

73,

John

Would there be some way to bring this to 222 MHz? I believe we have
100 KHz data channels allocated there (in this region) that have never
been used.

I assume this topic was brought up due to:

http://www.arrl.org/news/stories/2009/01/23/10585/?nc=1

Chairman and Liaison Appointments: Microwave Band Planning Committee: Tom Clark, K3IO, Chairman.

Also in the The ARRL Letter, Vol 27, No 29 (July 25, 2008), there is this interesting snippet:

* ARRL Board of Directors Plans the League's Future at Second 2008 Board Meeting

Regulatory Matters:
The Board voted to establish an ad hoc study committee to review Part 97 of the rules governing the Amateur Radio Service to ascertain what rule change(s) would be beneficial to promote wideband digital modes, while at the same time minimizing potential interference to narrowband modes.

Any bets that it takes another decade for the ARRL to come up with a set of ratified microwave bandplans?

1425. HSMM Class August 22, in Lucas TX

Yahoo group: DAWG-HSMM
Date: 2009-07-22 23:09:48 UTC
From: Kipton Moravec
Topic: 1425 Message: 1425

Amateur Radio operators in Austin have modified the OpenWRT code to make a WiFi Mesh network. The software is functional but needs improvements. We are also looking at a custom processor board (Service Processor) to add some additional capabilities.
Session 1: 8:30 a.m. to 10:30 a.m. Overview of HSMM and the Austin software
Limit 30 people.

Requirements: Nothing needed.

This session will be a slide presentation of using off-the-shelf Linksys routers with custom software and better antennas. Example systems will be on display. We will talk about events where we have used them. Finally I will propose a HSMM network in Collin County, or the metroplex.

Session 2: 10:45 a.m. to 1:00 p.m. Loading and testing the Austin Code.
Limit 20 people.

Requirements: Bring a Linksys WRT54GL (v1.0 or 1.1) router and a computer (Windows or Linux with an Ethernet port.) Extension cord, Power Strip, an Ethernet Cable and if you have a HT bring it.

In this session we will take the compiled code and load it into the WRT54GL router. Then we will take the routers outside and show them automatically joining the mesh, and providing Internet access. If time permits we may do range testing.

Session 3: 2:30 p.m. – 5:00 p.m. Loading the development system and code
Limit 10 people.

Requirements: Bring a Linux computer, because the development system is in Linux. No version of Windows will work. Also bring a power strip, and Ethernet Cable

In the session we will load the development environment and software to compile the Linux Operating system, OpenWRT code, OLSR (Mesh SW) and Austin Modifications. When completed you will have created the same binary file as you used in Session 2. This is often the first obstacle for people wanting to modify the software. The software needs more work, and we are looking for people to help.

Please signup by emailing kip@... with what sessions you want to attend. There is a limit to the number of people I can accommodate so please do not sign up if you will not show up.

The class will be at Gary Johnson’s Pool House, 299 Connor Lane. Lucas, TX. The sessions will start promptly. So be there early.

Amateur Radio operators in Austin have modified the OpenWRT code to make

a WiFi Mesh network. The software is functional but needs improvements.

We are also looking at a custom processor board (Service Processor) to

add some additional capabilities.

Session 1: 8:30 a.m. to 10:30 a.m. Overview of HSMM and the Austin

software

Limit 30 people.

Requirements: Nothing needed.

This session will be a slide presentation of using off-the-shelf Linksys

routers with custom software and better antennas. Example systems will

be on display. We will talk about events where we have used them.

Finally I will propose a HSMM network in Collin County, or the

metroplex.

Session 2: 10:45 a.m. to 1:00 p.m. Loading and testing the Austin Code.

Limit 20 people.

Requirements: Bring a Linksys WRT54GL (v1.0 or 1.1) router and a

computer (Windows or Linux with an Ethernet port.) Extension cord, Power

Strip, an Ethernet Cable and if you have a HT bring it.

In this session we will take the compiled code and load it into the WRT54GL router. Then we will take the routers outside and show them automatically joining the mesh, and providing Internet access. If time permits we may do range testing.

Session 3: 2:30 p.m. – 5:00 p.m. Loading the development system and code

Limit 10 people.

Requirements: Bring a Linux computer, because the development system is in Linux. No version of Windows will work. Also bring a power strip, and Ethernet Cable

In the session we will load the development environment and software to compile the Linux Operating system, OpenWRT code, OLSR (Mesh SW) and Austin Modifications. When completed you will have created the same binary file as you used in Session 2. This is often the first obstacle for people wanting to modify the software. The software needs more work, and we are looking for people to help.

Please signup by emailing kip@... with what sessions you want to attend. There is a limit to the number of people I can accommodate so please do not sign up if you will not show up.

The class will be at Gary Johnson’s Pool House, 299 Connor Lane. Lucas, TX. The sessions will start promptly. So be there early.

Sorry for reviving an old thread.

But I just learned that the XR-1 is an built to order Ubiquiti product. (Not that they do that sort of thing)

While there is a minimum quantity of 1000 piece per order due to the custom frequency, it does work out to about $150 per unit.

To bad this thing doesn't fit better into the 220 MHz band. One would think TAPR or someone could get behind this since the end user ham price is reasonable.

The next best possibility is at 420-440MHz, join up Digital-ATV with HSMM.

What's the possibilities in the 70cm band?

>)

Looks like the Plano public service wireless network will be used for more than just police... it will also be used by your lowly automated water meter (AMR) to send usage data to the plano water department.

(My water line was worked on this morning.) The current Datamatic Firefly drive-by RF AMR equipment will get updated to wifi over the next 5 years. Alas, it seems that while Datamatic, a Plano based company, supplies the Firefly AMR, the 2007 bid to update Plano's AMRs to wifi was won by HD Supply, partially owned by the Carlyle Group. However, even though the upgrade started in 1-dec-08, it seems that there are still wifi teething problems (of an unspecified nature). Cost of this wifi upgrade? $18M. I wonder how big the battery used by the wifi AMR is?

robert

PS:
All this time I thought that Plano had replaced my metal meter cover with a plastic one so that they could recycle the steel cover and make some money. My ham radio thinking cap wasn't on: radio waves pass through plastic easier than metal. In the past, during heavy rains, some street meter lids floated away when they weren't fastened down to meter lid moorings. (http://tinyurl.com/ncxsom) So, if you are out driving on a Skywarn night, occasionally look down for a floating lid.

PPS:
For those of you, in water restricted environments like Austin, who think you can sneak some water onto your lawn in the middle of the night... the automatic meters keep track of when the water flows, even the times during the day. So, late night water usage could be interpreted as lawn watering... if there's a pattern, some public employee might wander by in an electric car to catch you in the act. ;) Isn't technology wonderful?

From: Dave
Topic: 1432 Message: 1432

I recently got an email about HSMM. I read a few articles and searched the net here and there. I see that you need a ext. antenna, wifi router and a microphone. One of the articles said something about a microwave radio which could be had cheaply for 60-80 dollars. I havent been able to find out more about what all equipment is needed. I still not getting how it works I guess. I have antenna restrictions but I have most of the equipment I think. Point me in the right direction please !

OK OK ! I think I finally got the missing part ! You have to FLASH the firmware on the router so it basically becomes the XTMR for Ham Band.I some how missed that part in the articles. Once flash its a qrp microwave 2.4 ghz wifi xtmr with your call sign attached as the SSID ??

THANKS !!

Basically correct. Be aware that the wifi channels that you can
utilize for the FCC part 97 license overlap partially with the FCC
part 15 unlicensed channels. You can see how they overlap here:
http://en.wikipedia.org/wiki/High_Speed_Multimedia#Frequencies_and_channels
. There's nothing to prevent you from flashing your wifi router and
continuing to use the unlicensed channels, as long as you don't exceed
the restrictions placed on part 15 devices. (Eg, if you don't change
the antennas or increase the power of your off-the-shelf wifi router.)
Higher gain antennas and more power, resulting in more effective
radiated power, will require you to add your callsign and use only the
part 97 channels.

I think that the main purpose in flashing the firmware on the router
is to increase the capabilities of the device. The firmware that
linksys provides is sufficient providing an access point in a home.
Two popular sources of firmware that can be installed on specific
models of linksys routers are dd-wrt (http://www.dd-wrt.com/dd-wrtv3/dd-wrt/about.html
) and openwrt (www.openwrt.org).

I don't think you need a book to get started in hsmm, but certainly
the more you know, the fewer frustrations you'll have. Others have
recommended this book on 802.11: http://oreilly.com/catalog/9780596100520
. If you haven't seen n5oom's pages on hsmm, I recommend them: http://www.n5oom.org/hsmm
.

Hi Dave,

Actually I don't think the VHF digital hand book doesn't dive into the firmware aspects. You don't have to flash as the Part 15 (unlicensed wifi band) does overlap the 2400-2450 MHz amateur radio allocations.

You just have to be sure to select one of the overlapping Channels 1-6

Since the publication of that handbook, the Atheros chipset has become the hot snot (in my opinion), as it is possible via flashing to unlock other ham-only channels that are not in the overlapping sections.

I just looked at my Buffalo DD_WRT firmware and it already supports HSMM ! Also the Buffalo router is adjustable up to 250mw of power right out of the box ! Sounds like a good candidate for HSMM on ham bands.

Careful while the SW allows you to go to 250 mW, often the HW does not.
The HW can usually safely go to 70 mW without damage. Going above that
can get the transmitter too hot and damage the chips.

Are you near Dallas? We are having a HSMM Seminar in Lucas (East of
Allen) on August 22.

I would highly recommend attending Kip's presentation, if at all possible.

There are a limited number of people that have done significant field work
with HSMM and are working to help spread the information around. Kip is
one of them. I was fortunate enough to meet him at Hamcom 2009 this year.

There is some great stuff that can be done with HSMM and being the radios
are in mass produced consumer equipment, the price is stunningly low for
such technology. Some might assume that because they are relatively inexpensive
that current wireless routers don't have much inside them. They actually have
some of the most stunning technology around and it is only because the units
are sold by the millions that the price is so low.

This is truly the chance of a lifetime tor hams to get amazingly cheap radios
that are amazingly capable.

Yes I saw something about Lucas. I live close by in Melissa. I ll see what

work has for me on that day.

THANKS !

Dave

Woops wrong Dave.

This Dave,

We have a HSMM Seminar in Lucas on August 22. Did you see the announcement?

Kip

> I recently got an email about HSMM. I read a few articles and searched the net here and there. I see that you need a ext. antenna, wifi router and a microphone. One of the articles said something about a microwave radio which could be had cheaply for 60-80 dollars. I havent been able to find out more about what all equipment is needed. I still not getting how it works I guess. I have antenna restrictions but I have most of the equipment I think. Point me in the right direction please !

You got it! Thanks to Glenn for coming to the rescue. He is much better at explaining such things than that Champa guy you mentioned, otherwise that old 2004 article would have been sufficient, right? Guess we have learned a lot
in the meantime (HI).

The follow-up CQ VHF article will describe a simple xtal mod that changes the channel
11 (outside the Ham Band) frequency to between channels 2-3, thus rendering the
signals undetectable by Part 15 stations, or anything other than a spectrum analyzer.

BTW, one of my favorite suggestions for first antennas would be for a pair of MFJ-1800s.
They are simple, inexpensive, and work well, at least for initial testing getting started.

Good luck, thanks again, and please don't be a stranger here.

73,
John K8OCL

PS - One minor disagreement, respectfully, with Robert. There is nothing
that
prohibits you from using the Part 15 channels with bigger antennas and more
power,
as long as you are a licenced Radio Amateur. Just as long as your channel
center
frequency is at or below about the center frequency of Channel 6, you are
within the 2.4 GHz Ham Band. There are no actual Part 97 "channels" for
802.11
aside from general band plans and other such gentleman's agreements.

Having written that, of course, it would not be very neighborly to knock
your local
HS or PD off the are with your more powerful signal! An unlikely event, in
any
case, but that is why we always recommend an RF area survey as a first step.

I have made a spreadsheet that will be made into a slide with the data about the crystal change.

You can download it from http://www.kdream.com/HSMM/ALTFrequency.xls (case sensitive)

The whole screen is the amateur radio spectrum allocation in that frequency area.

The top section is the standard off the shelf WiFi. You can see that Channels 1-6 fit into the spectrum.

The second section is replacing the 20 MHz crystal on the transmitter with a 19.6608 MHz crystal (the next lowest that is readily available and costs under $1) With it we can use channels 7-11 in our band. Other countries allow the unit to have channels 12-14.
http://www.moonblinkwifi.com/2point4freq.cfm

So maybe with a software change we can add those channels also and with the crystal change still be in the Amateur Radio Spectrum.

With the crystal changes, the units can not be detected by unmodified units.

The third section is the ARRL Band plan. Because we are spread spectrum, we look like background noise to the narrow band signals.

Kip

The missing piece is still the client cards. It is all fine and good to modify a WRT-54G to do all this but having to drag another 54G around with your laptop to play is a pest.

This looks like a great way to create a WAN but the solution for the "last mile" is either CAT-5e or a Part 15 wireless LAN. Is anyone doing any work on getting PCMCIA or USB clients that will work on modified HSSM wireless routers? That would get us entirely out of the Part 15 world.

It depends on what you are doing and how you are doing it.

With DD-WRT the nodes were the backbone and you could also connect with your unmodified WiFi card.

The problem was configuration. It is a pain.

But that is how we have been doing it. And it works.

Now we are looking at what is being done with the Austin ARES-MESH and it is much easier to configure, it configures itself within 5 seconds of power-up.

This uses a different protocol OLSR. Designed to create a mesh network.

It is available in Linux. And they are working on windows drivers for some cards. Go to www.OLSR.org to see what they are doing.

I do not see it as such a pain. I am more interested in infrastructure. Once you get a signal to a building, you can use a regular unmodified wireless router to spread the signal to everybody else that needs it.

If I have one in my car I do not have to carry it. Just have it hooked up. Then I can hook it up with a CAT-5 cable, or have a wireless router in the car to reach my laptop wherever I am within range.

I do not think this will have 100% coverage anywhere.

The mix of part-97 and part-15 networks can work well, as Kip has pointed out. If we wish to help a served group / agency, we use part-97 gadgets like HSMM-MESH (new name for legal reasons), then we can break it out to normal Part-15 access points for general use.

This could give folks like the Red Cross Internet access, for example, in some place they needed it. To them they see a familiar Access Point, and how the Internet link got there is hidden to them. They don't need to know a thing about our mesh.

You really have to take a look at all the different ways networks could be set up and use what works for a particular situation. There are many, many useful variations on this theme.

Links should be monitored by the control operator.

Rather simple, to tremendously sophisticated software
exists to monitor computer networks and has existed for
decades. It is currently in use 24 hours a day, 7 days a week,
365 day a year. This email exchange we are having is likely
monitored by multiple such programs.

Some quite good software such as WireShark
is free, and will allow you to monitor and log every bit of every byte
of every packet that goes over the network. You can have it watch
for IP addresses and particular bit patterns, among other things.
Different types of packets may be color coded as the user desires.
Please refer to the WireShark manual for details.

Wireless routers are "routers" and can strictly control what address
ranges are allowed over the network. You can block specific addresses
if you wish. They must be configured by the user in order to do effective
routing and filtering. Leaving such a device with the default settings may
not be optimum for security purposes.

It is common for network administrators to spend a great deal of time
configuring and securing their networks. This is an ongoing task, not
something just done once and then not checked again.

Many aspects of HSMM will invite consideration of updating current rules
that were written before the technology ever existed.

The only way, as always, to be absolutely sure there is no
violation of third party traffic rules or other regulations,
is to turn off your radio, and stay off the air.

Yup, and as I have a job in Information Security I interact with them regularly. Unfortunately, none of them can achieve what Part 97 requires. (Nothing "naughty", no encryption, etc). Wireshark/tcpdump/snort/etc are purely passive monitors and while they show when someone might be violating Part 97, it does nothing about it. Wireshark's live display will also be quickly overwhelmed if there are more then a few users using the connection.

Having a secure connection and having something that is Part 97 compliant are two different things. Part 97 severely hamstrings certain security measures that are standard in most networks. What needs to be done is active traffic content monitoring, which does exist in some forms, but is far from bulletproof.

> Many aspects of HSMM will invite consideration of updating current rules

Unfortunately, at Dayton, I got the impression from the FCC that no such reconsidering is forthcoming. They feel that current rules work fine.

Or, just not provide access to 3rd parties, but that just gets us back to square one.

I believe hams should try to go by the rules. That is what we agree to do when we get our ticket, and get some pretty generous privileges.

I am not a lawyer, I am not empowered to enforce the rules, so my opinion has zero (0) legal standing.

At some point new rules for new communications modes makes sense. The legal system does not always make sense and is always way behind technology.

I try to go by the rules and encourage others to do the same. Beyond offering a few suggestions on how an operator might attempt to use some technical means to try to comply with the rules, my least favorite part of ham radio is discussing hypothetical legal considerations. Some seem to enjoy it a lot, as there are many such discussions.

The FCC has a lot of spectrum to sell for wireless gadgets and is constantly under heavy political pressure. I don't think hams experimenting with HSMM is really of much concern or interest to them.

Check the enforcements section of QST to see what the FCC cares about enough to take action.

I have technical interests and an interest in helping with emergency communications. If faced with an emergency where I might be of some help, I will make a decision I can live with, and hope any that might stand in judgment of me, will do the same.

Others can discuss the rules for as long as they like.

Amen!
In the absence of exact FCC legislation to govern what we can and cannot do on the airwaves, we are allowed to use good engineering judgement and good amateur practice - common sense. This is our grant to homebrew and try out new equipment and modes on the amateur bands to determine if they are viable under varying operating bands and conditions (weather, propagation, public service/emergency).

I believe hams should try to go by the rules. That is what we

agree to do when we get our ticket, and get some pretty generous

privileges.

I am not a lawyer, I am not empowered to enforce the rules, so my

opinion has zero (0) legal standing.

At some point new rules for new communications modes makes

sense. The legal system does not always make sense and is always

way behind technology.

I try to go by the rules and encourage others to do the same.

Beyond offering a few suggestions on how an operator might

attempt to use some technical means to try to comply with the rules,

my least favorite part of ham

radio is discussing hypothetical legal considerations. Some seem to

enjoy it a lot, as there are many such discussions.

The FCC has a lot of spectrum to sell for wireless gadgets and is

constantly under heavy political pressure. I don't think hams experimenting

with HSMM is really of much concern or interest to them.

Check the enforcements section of QST to see what the FCC cares about

enough to take action.

I have technical interests and an interest in helping with emergency

communications. If faced with an emergency where I might be of some

help, I will make a decision I can live with, and hope any that might stand

in judgment of me, will do the same.

Others can discuss the rules for as long as they like.

So you use a HSMM-MESH node running OLSR (great MANET protocol, btw) as the trunk and Part 15 devices and wireline devices for access. Technically speaking, this is a very satisfying and stimulating approach to achieving the original goals of the HSMM initiatives.

Regulatory Thoughts:

Having served as an elected official who worked day to day with a governmental bureaucracy, I would advise caution when evaluating arguments for not worrying about Part 97 considerations and Third Party rules. To be frank, in my judgement the arguments posted in this thread were neither convincing nor likely to stand if challenged. The two main arguments appear to be based on Civic Altruism and Official Neglect.

Appeals to altruistic motives can keep one warm at night and make one popular at the EOC but do not stand when some bureaucrat or agency takes umbrage. [Only government officials seem to get away with being judged by their motives and not by their deeds.] One only has to understand the regulatory mind to find out that there is no right and wrong, only compliance or violation of the body of regulation. To the enforcement bureaucracy pure motives are immaterial. Only venal or corrupt motives are useful when their presence can be used to enhance the success of prosecution (criminal jurisdiction) or assessment of apparent liability (administrative jurisdiction).

Next, the lack of enforcement activity or focus by the FCC ("Official Neglect") cannot be taken as tacit approval. It sounds to me like there needs to be some petitions to the FCC and a few NPRM cycles to try to fix any defects exposed by the demands of Amateur wireless data communication. I think this terribly thin ice upon which to build an edifice of one's treasures and efforts. FDR is the only historical figure I remember in this country who ever got away with acting contrary to law and then trusting that the constitution and law would eventually catch up.

Disclaimer

The above is purely practical observation of one citizen to others and does not constitute legal advice. Let me say clearly that I have no love for the constant expansion of federal power and expend no small amount of time and treasure to restrain it. That said, this is the environment in which we currently operate and which, in applying for licensure, we gave our contractual approval to support. Though I think the whole Communications Act of 1934 approach is far from the right way to provide communication sanity and civility in a free society, it is the current framework under which we must operate unless we are prepared to mount a supreme court challenge to NCA-34.

The antenna systems on those devices are not conducive to long distance transmission and the emission levels, for safety reasons, are also part of the issue. What you need to do, is use a part 15 router connected via ethernet to a part 97 router and use part 15 cards to talk to the part 15 router.

Part 97 says that you must document encoding. It does not say "no encoding".

Glenn,

Many thanks for the most interesting talk at the Dallas (Plano) HamFest. I live in Corpus Christi and have been coming to Ham Comm since before the Arlington site. Most interested in trying to stir up some tech interest around here. There is an especially strong interest in public service and emergency communications.

I do have S band ham radio (Linysys router) that I bought at Goodwill on the way, just my luck it is a version 5.
Perhaps I can do a presentation for one or more of our two ham clubs. I'm really hampered by living far away though. Are there any presentations I could shamelessly copy from? Attached is my 'brain dump' this week, really short on details and graphics. I see the Lynksys routers are $25 to $60 and the antenna about $30, cables tripod, Ethernet power injectors, etc. could bring up a node cost to say $150? For a demo, I really need two version 1-4 routers, I will look around, but our Goodwill, etc. stores are mostly clothes.

I have seen an email that says the recent CQ has an article on HSMM-MESH, sadly my sub has expired. I did look on the CQ web site and did not see it in the most recent posting (which was August issue).

Know you guys are having a great hamfest, wish I didn't have a conflict this weekend and could be there.

Thanks for all the development work you guys have done on HSMM-MESH

Thanks,

I will get you some info you can use for presentation.

I have had some help getting a vendor table at the Austin Summerfest
this weekend. I will be there as much as I can and help with mesh firmware loads
and answer questions.

Gregg is correct. The method suggested by the old HSMM WG for "documenting" is a posting on a special page on the ARRL web site explicitly intended for such encoding scheme storage, or in this case "publication" or "documenting".

However, in practice, any public web site accessible by Radio Amateurs is just fine.

This, of course, also includes encoding schemes for the purpose of encryption. *

Just as in the case of repeater owners, you are NOT required to also post your
encryption key. That would defeat the purpose of the encryption. However, the WG
did recommend that the encryption method AND THE KEY (e.g., WEP using HSMM-) be recorded in the Radio Amateur's official station log book.

Of course, those logbook are not required any longer either (HI). It was simply a
recommendation by the WG to comply with the spirit of "best practices".

73,
John K8OCL

*The FCC stated to the ARRL attorney that Radio Amateurs my encrypt their HSMM
networks for the *protection of the network*. It was not considered by the FCC as an
attempt to "obscure the meaning" of the transmissions so thus it is not considered a violation
of the regulations for Radio Amateurs to encrypt their transmission for the purpose of
network security, e.g. HSMM-MESH networks using WEP, etc.

Caveat: ITU (the UN) regulations prohibit any encrypted transmission over international boundaries.
Of course, governments do this on a daily basis (HI). So this FCC approval applies to Radio Amateurs
only within FCC jurisdictional areas (US, possessions, etc.).

We ended up having a vendor table for the HSMM SIG at Summerfest
courtesy of WA8EXE. Larry had attended Hamcom 2009 and sat in on
the HSMM presentations given by K8OCL and KD5MFW.

He contacted me about HSMM-MESH firmware and I emailed it to him.

He loaded the firmware on a couple of WRT54G routers and had mesh
links going, but had questions that could not be easily resolved via
email.

We decided to link up at Summer fest and having a vendor table with

power gave us a place to work. We resolved a number of issues and
seem to have turned up a bug in the version 3 firmware.

I was able to take several of my used Goodwill Computer store routers
and turn them into mesh nodes by loading the HSMM firmware during

Summerfest.

We had many people stop by the table and talk about the mesh system
and the crystal mod was especially of interest to many.

This went so well that I will attempt to go to some of the area swapfests,

like Belton and simply pay for a vendor table and do HSMM support.

I would plan to have a few signs and a laptop with large screen running
a HSMM overview slide show, and have a few single page handouts.
Other than that this would be a way of doing hands on field support

and with all the walk by traffic even those with limited interest would
be able to spread the word that there are hams actively modifying
consumer Wi-Fi gear for ham use.

Many thanks to all that stopped by to help and again to WA8EXE for

footing the bill for this first HSMM promo / field support effort.

I hope to get a few more people trained to down load mesh firmware
and be able to give a basic overview of our mesh work. If we can
get support reps in near the major pockets of interest, we can more

rapidly grow the mesh ranks and improve technical help.

Glenn,

That is wonderful news! Did you happen to take some photos that we can published in the *CQ VHF* HSMM Column? Always need good photos!

BTW, my XYL (wife) Karen is an excellent sign maker. And unlike some of my dear correspondents, she actually knows how to spell "HSMM" (HI).

Karen recently made a beautiful fund raising sign for my cigar club. We dutifully mounted it in our bi-sexual rest room. Sound strange? With the considerable amount of 807 (beer) drinking we frequently do, it gets considerable
attention at that location. Hey! Don't laugh. It works for AMSAT at Dayton (HI).

1467. Last Chance to sign-up for HSMM class

Yahoo group: DAWG-HSMM
Date: 2009-08-18 04:07:35 UTC
From: Kipton Moravec
Topic: 1467 Message: 1467

HSMM Class August 22, 2009

Amateur Radio operators in Austin have modified the OpenWRT code to make a WiFi Mesh network. The software is functional but needs improvements. We are also looking at a custom processor board for some additional computer hardware.

Session 1: 8:30 a.m. to 10:30 a.m. Overview of HSMM and the Austin software
Limit 30 people.

Requirements: Nothing needed.

This session will be a slide presentation of using off-the-shelf Linksys routers with custom software and better antennas. Example systems will be on display. We will talk about events where we have used them. Finally I will propose a HSMM network in Collin County, or the metroplex.

Session 2: 10:45 a.m. to 1:00 p.m. Loading and testing the Austin Code.

Limit 20 people.

Requirements: Bring a Linksys WRT54GL (v1.0 or 1.1) router and a computer (Windows or Linux with an Ethernet port.) Extension cord, Power Strip, an Ethernet Cable and if you have a HT bring it.

In this session we will take the compiled code and load it into the WRT54GL router. Then we will take the routers outside and show them automatically joining the mesh, and providing Internet access. If time permits we may do range testing.

Session 3: 2:30 p.m. – 5:00 p.m. Loading the development system and code
Limit 10 people.

Requirements: Bring a Linux computer, the development system is in Linux. No version of Windows will work. Also bring a power strip, and Ethernet Cable

In the session we will load the development environment and software to compile the Linux Operating system, OpenWRT code, OLSR (Mesh SW) and Austin Modifications. When completed you will have created the same binary file as you used in Session 2. This is often the first obstacle for people wanting to modify the software. The software needs more work, and we are looking for people to help.

Please signup by emailing kip@... with what sessions you want to attend. There is a limit to the number of people I can accommodate so please do not sign up if you will not show up.

The class will be at Gary Johnson’s Pool House, 299 Connor Lane. Lucas, TX. The sessions will start promptly. So be there early.

1469. L-Com's APC

Yahoo group: DAWG-HSMM
Date: 2009-08-22 14:14:40 UTC
From: kb9mwr
Topic: 1469 Message: 1469

I just read the latest HSMM column in CQ-VHF. Very nice by-the-way.

I saw the note how ham spread spectrum APC is no longer a requirement for hams under the Part 97 Spread Spectrum Rules. The FCC considers APC for hams who often build their own equipment, including BDAs-"technologically impractical."

(As that ham rule had TDMA spread spectrum in mind and is referring to power control on a per packet basis.)

There seemed to be some question as to what L-Com's APC/AGC (automatic gain control) really is.

It's just circuit basically just automatically adjusts the amplifier's gain to provide a constant output power regardless of cable length.

Thought I'd share that. I have one of their 10 watt 900 MHz BDA's that has that type of APC.

1470. Netgear WGR614L ? does anyone have experience with this?

Yahoo group: DAWG-HSMM

From: kc6pob
Topic: 1470 Message: 1470

Has anyone modded a Netgear WGR614L for hsmm use? I have seen them at Frys Electronics. The L suffix is significant as it is advertised as a Linux box versus the standard unit without the L. Interested in the unit but currently have little time to devote to development work as I am working on integrating cellular, LMR, and point to point microwave networks through my employer.

Processor (unknown) clocked at 240MHz, 4MB flash, 16MB RAM. 12VDC @1A and 4 10/100 switched ports.

73,
kevin

A couple of the people in Austin have them, but have not had too much
time to play with them. Or support them with the hsmm software.

This looks like a good routher for OpenSource use.

The Broadcom chip used is a follow on to the chip used in the WRT54 series and OpenWRT has already been ported to this new chip.

Since the same Processor core is used OSLR should run as is on this new chip, someone needs to build an image and give it a try.

1474. Interest in using HSMM in Maine

Yahoo group: DAWG-HSMM
Date: 2009-09-09 14:34:18 UTC
From: cgolob
Topic: 1474 Message: 1474

I am interested in trying HSMM in Maine, first trying to use it at a neighborhood level (since there are 4 hams who live on the same street in about a 1 mile range).

I am curious what software people have found successful for different applications (voice, tranfer of files and keyboard-to-keyboard communications).

I would like to be able to do this with unmodified equipment, but if needbe, I do have another router with DD-WRT firmware on it. That router is currently being used as a wifi repeater; Can a DD-WRT router be used for HSMM and a wifi repeater at the same time??

If you modify a router for HSMM by putting a gain antenna, it is no longer a part 15 device, so then only Amateur Radio operators can use it.

I am not sure what you mean by a Wifi repeater (I am guessing WDS) but yes it can be used as part of a DD-WRT WDS system and still allow users to connect wirelessly.

We are experimenting with software that makes it a Mesh network.

Let me rephrase. Has anybody successfully connected to another computer WITHOUT connecting to the internet and been able to communicate via voice, keyboard-to-keyboard and/ or exchange files??

I do not see any point in modifying equipment unless I absolutely need to. It is my understanding that amateur radio operators are primary users of 2.4 ghz channels 1 through 6 and we can operate at higher output whereas regular consumers are secondary users and must stay within the power range of 100mW. In fact, I do not mind if normal consumers operate this means also because ultimately I would like to set up a backup network of communications on 2.4 ghz in the event normal means of communications fail since wireless routers are affordable and readily available.

Good question. Austin, Texas seems to have a handle on HSMM. I see your point about simple and it is a good one; Keep It Simple is the best phrase. COTS hardware, minimally changed if at all, adapted to our use by incorporating specialized antennas will work. I think the EZ-Bridge stuff seems like the way to go (maybe others?); inexpensive, COTS and if a router or switch was used at each end a complete point-to-point or mesh network -independent of the internet- will be created.

I assume COTS means Commercial Off The Shelf (readily availble) devices. Looking up EZ-Bridge that must be to extend range of the signal?? Now the important piece to the puzzle is what software people are using to communicate?? For example, using Skype to connect to another computer and exchange voice data (which I doubt would work since it looks for an internet server).

Cory, if you build an HSMM network you should be able to use most of the same applications to exchange data/voice/video/chat or transfer files that you use over the internet. The exceptions would be those applications that utilize a back-end server (such as many IM implementations) since obviously such servers wouldn't be accessible from your HSMM network. Here's an example - if someone sets up a web server somewhere on the HSMM you would be able to access it via a browser elsewhere on the HSMM network. Another example would be using telnet to gain access to a Linux box at another location. Yet another example - FTP or TFTP can be used to exchange files just as you would with an internet-based host. It's likely, though, that you would need to know the IP address of the remote device unless you add entries to your local hosts file. Coordination of address space and an exchange of host address information with other users on the HSMM would be key in successfully connecting to other devices.

In summary - most applications that operate in an IP environment will operate normally over HSMM (again, unless they have some dependency upon internet-based hosts). You won't need any special applications to accomplish the tasks you've mentioned.

73, Brian WB9QVR

It should also be possible to put a small public server on the HSMM network to do DHCP and perhaps DNS for just the private network. If you end up with many participants manually allocating IP addresses could get tedious. This server of course introduces a point of failure if you're thinking of EMCOMM.

Re Applications, MS NetMeeting (sorry about that Linux folks ;o)in ad hoc mode should work, right?
Also an amplifier (bi-directional) should *NOT *normally be needed unless you have a long feed line. Find a good path (antenna height needed, gain, etc.) first!

More importantly, do a site survey *BEFORE* you select a channel (1-6) to use for HSMM. NetStumbler is a good survey tool and is FREE.
Yes, you are Part 97 (I believe we are actually secondary licensed), but it would be best not to operate on the same channel as the local unlicensed Part 15 high school, etc. (HI)

Hope that helps,
John K8OCL

There are also IM servers that you can set up on a public server. If you have a big server, you could install Windows Communications Server. For somewhat less money and an Apple, you could setup an iChat server on OS X Server. But there are plenty of free IM servers as well.

I believe, if you and your friends have Apple computers, you can communicate without a public server using your iChat client. These clients use a service called Bonjour (aka zeroconf) to announce their presence to each other when on the same subnet. The iChat client has support for audio and video in addition to the standard text messaging. I'd be surprised if there aren't other IM clients with these features, but I don't know of any personally. (Gajim seems to have zeroconf support.)

(zeroconf is more commonly used to automatically set up printers that have ethernet support, which could come in handy in staging areas. ;))

One of the things that I like about IM clients is that some of the IM servers have support for group chat. This could be useful in an emergency setting.

And if you're worried about single points of failure, you could always create a LiveCD that includes the software that you are interested in, and distribute it to folks who have spare PCs and generators, so that if one fails, another could be brought online. ;)

Finally, I've heard that if two folks have IP phones, then you can communicate using those--no asterisk server required.

For Voice Communications over High Speed Multi Media take a look at
Asterisk (www.asteriskradio.net).

Asterisk is a PBX and RF Gateway tool chest that can operate without the
need for a central point for the database (for example a Asterisk PBX
plus extensions using softphones, wifi phones or deskphones {using SIP /
IAX2 protocols}). Yet at the same time it has the capability to tie
together many servers together create systems and networks. Where the
Internet is available a point of access to the PSTN (regular telephone)
as well as ITSP (Internet Telephone Service) can be brought into the
system via Asterisk.

Yup. Been there, done that, used it in a demonstration of 802.11 for
VHF contesting. MS Netmeeting was about the only app I could EASILY
find that would allow audio/video to go point-to-point.

On the other hand, an XMPP or Jabber server could be set up on the local
network/mesh. Not sure of any Linux apps that would/could use A/V but...
I haven't looked.

This *IS* something that *NEEDS* to be researched 'cause these apps
are needed, especially for us Linux critters. :-) Guess I'll run off
and do that sometime this week.

I was brought up using windows and have been using Linux for the past month or so (very very new to it - using Ubuntu). I found that there is a MS Netmeeting for Linux called Gnomemeeting which also has a successor Ekiga. I wonder if Gnomemeeting would be interoperable with somebody who had MS NetMeeting.

Also I have been using a consolidated chat program called pidgin which has several chat programs in one
Supported chat networks:

* AIM
* Bonjour
* Gadu-Gadu
* Google Talk
* Groupwise
* ICQ
* IRC
* MSN
* MySpaceIM
* QQ
* SILC
* SIMPLE
* Sametime
* XMPP
* Yahoo!
* Zephyr

I am sure Yahoo and Googletalk would not work, but maybe there is a program there that can be of use.

A friend of mine thinks that Ventrillo would work, however, the free version will only accommodate up to 8 people. He is able to set up a server for it. Has anybody tried Ventrillo??

There are so many different types of servers I can only list a few -and they are free, easy to set up and fast: TeamSpeak (multi-caller voice comm and conference); OpenFire (video, chat, voice); HMailServer (Pop3, SMTP email); Trix (PBX).... lots of stuff that can run on an XP machine at one end on a dedicated machine, with other PCs at both ends for clients. Way many options for HSMM. And they are free.

For Voice Communications over High Speed Multi Media take a look at
Asterisk (www.asteriskradio.net).

Asterisk is a PBX and RF Gateway tool chest that can operate without the
need for a central point for the database (for example a Asterisk PBX
plus extensions using softphones, wifi phones or deskphones {using SIP /
IAX2 protocols}). Yet at the same time it has the capability to tie
together many servers together create systems and networks. Where the
Internet is available a point of access to the PSTN (regular telephone)
as well as ITSP (Internet Telephone Service) can be brought into the
system via Asterisk.

Absolutely. I've been using wireless IP phones over wireless links to ham friends for a few years. An Asterisk serve made it more fun as we could setup a conference room. In the past I've used cheap D-Link IP cameras over the same links.

In the past year I did learn of a few other HSMM deployments in my own home state:

Gosh darn it, my anecdotal evidence is more sound then your anecdotal
evidence! ;)

As always, YMMV, but... I had a Part 15 802.11b AP that would stop
functioning when the Microwave nearby was on. It wasn't coincidence
either, I verified it by testing it repeatedly.

This was 2000-2001ish, so there might have been advances to better
compensate with interference, but it isn't unfounded.

I agree with Ben that it is not unfounded. I worked for an ISP that was deploying indoor and outdoor wifi nodes and there were situations where industrial microwave ovens found in some food places (Subway, Starbucks, etc) would actually knock users offline. We could repeatedly re-create the problem and used a laptop based "spectrum analyzer" to see what was going on. Now, that being said, I have never had any problems while running my microwave at home and using my laptop, wifi phone etc. so I dont think a blanket statement about it "always" or "never" affecting devices is applicable.

Josh,
That is probably the best overall approach, "sometimes. but not always".
Wonder is food particles on the door frame might weaken the shielding.
AMSAT did massive studies to try to determine if a 2.4 GHz link might
be disturbed by all the microwave ovens on Earth. It just wasn't a factor.
Poor antennas? (HI)

On the other hand many of the RMG guys do not like us for "contributing to
the
noise floor". Each his own, right?

In the end, I stick by my original claim that microwave ovens are not an
issue
of any significance and to focus and work on that aspect is a waste of time.
Our very limited resources are better devoted to other aspects than a nit.

Yep. Nothing magic about being connected to "the internet". Anybody can
set up web or ftp servers, and there's client to client software for virtually
everything that don't need servers. The only issue you might really run
across is that you'd have to use IP addresses instead of domain names if
you don't have a DNS server on your network.

Confirm asterisk - I'm using it through the "PBX in a flash" distribution, which includes a complete Asterisk & linux installation on a single CD. I'm in Canada, using it installed on a server back in Dallas to make all my calls back home. However, it works fine as a local PBX with no external internet connection.

I have been overwhelmed with issues at work and not been able to spend time with the HSMM email lists for about a week. I have been interested in the HSMM stuff for years and have pushed to try to help overcome some of the practical problems to make the stuff easier to use, cheap and generally promote a robust broad band communications for ham radio use.

Great work guys, lots of good questions, answers and discussions.

I look forward to following all the interesting URL pointers to interesting information.

While I may have been able to help with some of the questions, most look like they were eventually well answered and have made fantastic use of this yahoo group tool.

Sorry I was out of action for so long. I had over 200 HSMM related emails to sort through this Saturday morning / afternoon.

Thanks for the interest and good info shared. I am convinced that this HSMM stuff is interesting to tinker with, and also quite useful for a variety of ECOM work.

We just need to share what information we have and keep getting in real results from field testing so we can help others understand what HSMM is good for, but not over sell it.

There is a lot to it, and the info is EASILY confused.

After working with it for 8 years, I learn new stuff about it every time I set up another test and do some field work or more reading.

After a very tough week at work, it is enormously refreshing to see so much activity regarding HSMM.

Keep the info and questions coming!

Yep. Nothing magic about being connected to "the internet". Anybody can set up web or ftp servers, and there's client to client software for virtually everything that don't need servers. The only issue you might really run across is that you'd have to use IP addresses instead of domain names if you don't have a DNS server on your network.

Sounds like you want to set up your NIC for an "ad hoc" network, which means whatever computer(s) it is within range of, become a peer-to-peer network. No internet needed. Any software that works from one computer to the next, should work on an ad hoc network just as well as it would on the internet.

Check it out, there are a couple of major efforts to deploy these over large areas, i.e. whole neighborhoods or cities, via WiFi.

Perhaps this has been answered many times already. I have been too busy to check messages on this list for over a week.

Yes, there are many ways to connect two computers via wireless links without using the Internet. It has been done by many people for about a decade now.

One way is to use the ham radio oriented HSMM-MESH developed by the Austin HSMM Special Interest group.

The idea behind HSMM-MESH is to take advantage of inexpensive consumer wireless computer networking equipment (wireless routers) that come out of the box, usable in the 2.4 GHZ ham band.

HSMM-MESH is basically a firmware update for a Linksys WRT54GL wireless router and its purpose is to network many computers without any need for the Internet. Voice over IP (VoIP), - digital telephone, file transfer, keyboard, mouse screen linking, live video can all be passed with absolutely no need for an Internet connection.

It CAN be connected to the Internet very easily, if you want to, but it is designed to be a rugged ECOM broadband ham radio digital network that requires only the resources provided by individual hams in an area.

Basically to use HSMM mesh you buy several WRT54GL routers, load the HSMM-MESH (trademarked) firmware which is free, into the routers. This takes about 5 minutes to do once you know how.

Your call sign is also added so the mesh node beacons your call sign for you automatically.

Here is an example of a point to point link.

Pug your PC into the back of a mesh node using a CAT-5 cable. Have someone you wish to link to plug their PC into the back of their mesh node and if the nodes are within RF range, they will automatically link and passing data in about 5 seconds.

You now have a basic link that is essentially equal to connecting the two PCs back to back with a single CAT-5 cable.

ALL the rest is standard computer networking.

Now computer networking is a very large subject, but ANYTHING you could do with the two computers wired back to back, and more, can be done using the mesh wireless links, instead of the CAT-5 CABLE.

The computers are essentially unaware of any difference between the connections.

Now you could fill a library with books on what you can do with the system now.

We have the mesh nodes auto linking and working nicely. We are now working on several applications. to use the network.

One is to support VoIP telephone service over the mesh, with no connection to the Internet required. It can be a complete stand alone system.

You will be able to connect it to the Internet but it is designed to be very useful and very robust, without requiring any connection, whatsoever to the Internet.

There are a lot of details and people working on the details.

To easily understand how all this works, requires two main areas of knowledge,
Computer Networking
and
modern broadband RF techniques.

Both are huge topics. If you are an expert in both we have had new HSMM members set up stations and be passing data withing 4 hours of receiving the HSMM-MESH firmware. This is quite the exception, as this person is quite an expert in both areas.

He set up 2 stations and passed data between two stations several miles apart, in about 4 hours of reciept of the HSMM-MESH firmware code.

Most hams could not do that, but it has been done by a mermber of the Austin HSMM SIG.

If you are not an expert in both the needed areas, don't give up. Keep up with the groups like this one and hams are working hard to get large modules of ready to deploy and use systems that simply need you to know how to use a web browser, like Internet Explorer or Firefox in order to use them.

In most areas of ham radio you have people that participate at all levels.

We are working VERY, VERY had to make a HSMM-MESH easy to use and have some very useful Video and telephone applications running that require minimal knowledge and training to use.

So if you have an interest, and keep asking questions and work out a step by step plan that gets your from where you are with HSMM, to where you want to be.

Please keep in mind the HSMM-MESH developers are all doing their development work in their spare time, so we proceed as resources allow.

But the more we can get the word out that good stuff can be done wiht cheap consumer routers modified for ham radio use, the more resources we will have to work with.

Thanks for yoru intrest.

Glen- You got it; HSMM is really simple, easy, fast, quick and right up our alley. Try Trix as a PBX; because of its' installation process my feeling is that it is much better than Ask.. . It is also an OS so bring an empty PC you can dedicate. It has OpenFire inside and that, along with Spark gives text, email, voice, web camera images, file transfer.... So much.

So, IMHO; if you want to do Ecom right, do a HSMM link between a field support group and a base camp. With the right antennas and maybe an amp (in-line) a distance of many miles can be set up. No, not HF but really full-featured and able to cover a good part of an area.

Now to build a *single* CD of Trix with an OS, Paclink, RMS, sound card TNC, and a smiley face too. With pictures, of course.

1506. ISO 6523 Naming for Networks, Services and Applications

Yahoo group: DAWG-HSMM
Date: 2009-09-14 01:24:40 UTC
From: J. Gordon Beattie, Jr., W2TTT
Topic: 1474 Message: 1506

Hi Folks!

Here is an idea that may be useful for structuring network element and service or application identifiers for Amateur Radio.

Years ago, this was something that was cooked up to get us past the IP address space and broaden the naming conventions that we might choose to use within Amateur Radio. It was always thought that the old "protocol wars" of Amateur Packet Radio needed to be transcended and this was an intellectual product that may be useful in a broader context. With HSMM introducing notions of Hinternet and Internet interoperability, we might want to take a look at this coding scheme for our HSM networks, services and applications.

Check out Code "0011" in the ISO 6523 document and perhaps we could start a dialogue on that either here or elsewhere.

Glenn,

IPv6 is the right answer, but I was thinking, as you hinted, that we may want to consider it for what rides above it, so that we don't need to resolve IPv6 addresses associated with specific applications and services manually.

We might consider integrating the interoperability controls into the naming at gateways for instance, and knowing the application name and domain in which it rests may be useful. For example, even when there is no radio involved, Echolink wants validated users or service points, so if we parceled out a service name that implied Echolink, then it would be able to autonomously determine who gets naming space in their world while also enabling those who are so "blessed" to seamlessly integrate their systems.

So (heresy to follow) if we wanted to allow Echolink to IRLP to DSTAR integrated networks or integrate any of those with other networks or application services, we would have a way to indicate to our edge gateways (application or service and not necessarily network gateways) how to carry the transaction or other communication.

Read on and we can discuss it some more when we all have had some time to brainstorm a bit.

Thanks & 73,

Gordon Beattie, W2TTT

Yes,

For a variety of reasons, having ways to be more cleaver about how to traverse an enormous address's space will pay dividends in better response.

We are looking at ways to make the best use of APRS messaging, and possibly add messages for mesh status.

There was an article in QEX a while back by Mitchell where he showed how he had integrated a wide variety of digital ham modes.

As for D-STAR, EchoLInk etc. we need to do our best to blend them together. Recently Bob, B. the inventor of APRS proposed a universal text message scheme for ham radio. I am still pondering the implications.

I am interested in fast smart routing so when we can use our fixed and mobile mesh nodes in a store and forward way to pass data, we have an efficient system. Some sort of tagging could bypass a brute dumb, brute force method of linking.

Lots to think about, thanks for pointing out the previous efforts in this area.

We hams (at least some of us) really get on all the different government agencies to work out better interoperability. We have plenty of our own interoperability within ham modes to keep us busy for quite a while.

If the data / message every goes through a server, we should have some way to cross link it to whatever other modes make sense. Sending live video as short APRS messages just does not sound like a good idea just due to bandwidth considerations, but many of the major digital modes remain "islands" in a digital sea and we should do what we can to cross link them, and some sort of tagging system at a higher level than IP could be used to sort it out.

Lots to think about.

Glenn,

IPv6 is the right answer, but I was thinking, as you hinted, that we may

want to consider it for what rides above it, so that we don't need to resolve IPv6 addresses associated with specific applications and services manually.

We might consider integrating the interoperability controls into the naming at gateways for instance, and knowing the application name and domain in which it rests may be useful. For example, even when there is no radio involved, Echolink wants validated users or service points, so if we parceled out a service name that implied Echolink, then it would be able to autonomously determine who gets naming space in their world while also enabling those who are so "blessed" to seamlessly integrate their systems.

So (heresy to follow) if we wanted to allow Echolink to IRLP to DSTAR integrated networks or integrate any of those with other networks or application services, we would have a way to indicate to our edge gateways (application or service and not necessarily network gateways) how to carry the transaction or other communication.

Read on and we can discuss it some more when we all have had some time to brainstorm a bit.

Thanks & 73,

Gordon Beattie, W2TTT

Hi Folks!

Here is an idea that may be useful for structuring network element and

service or application identifiers for Amateur Radio.

Years ago, this was something that was cooked up to get us past the IP

address space and broaden the naming conventions that we might choose to use

within Amateur Radio. It was always thought that the old "protocol wars" of

Amateur Packet Radio needed to be transcended and this was an intellectual

product that may be useful in a broader context. With HSMM introducing

notions of Hinternet and Internet interoperability, we might want to take a

look at this coding scheme for our HSM networks, services and applications.

Check out Code "0011" in the ISO 6523 document and perhaps we could start a

dialogue on that either here or elsewhere.

http://www.cyber- identity. com/download/ ICD-list. pdf

Thanks & 73,

Gordon Beattie, W2TTT

AMPR.org numbers definitely should be considered. There have been pieces of work done the past that still have a place. There was a lot of effort and good ideas developed, then the Internet took off, and now we are back to seeing how we can fit some of the pieces together.

I am confident that some pieces like AMPR.org numbers probably still have some value, even though the world has changed a lot and they are not a complete solution to the new world.

The particular HSMM-MESH work we are doing in Austin is just ONE way to do things. We have worked for years to get a complete working system together that solves many of the problems of our original target project. We have that figured out, but our current efforts are an initial effort to get something that is truly useful and get it built
as cheaply as possible. That is why we went with the wireless routers - too cheap and too good to pass up.

But it is just a start (years of work for our team, but still, one specific example of what can be done) and we are ever adding to it and looking for ways to expand. Once there is more interest we will gain more resources and if we get enough hams buying gear, the manufacturers may start to pay attention to our needs / interests. Many small changes by the manufacturer would be helpful to the ham community. We just have to have enough people buying gear to catch the interests of the manufacturers.

This is possible, not just a pipe dream. Cisco, does not have to continue to make the WRT54GL or introduce the WRT160NL, but they have features put there especially for the hackers (among programmer experimenters, hacker is not a negative term, it is like "home brew") So Cisco is paying some attention and producing products for the experimenters and not just the mass market, and they don't have to do that.

If we get a few large mesh systems in Austin, the Dallas area etc. Cisco and others will hear about it.

Remember our 2 meter radios started out as converted taxi cab an deliver truck radios and look what they are like now.

Lots and lots of cool stuff to do.

So many projects, so little time.

Mars,

Of course!

I'm thinking that we need to move beyond the simple issue of network (meaning L3/4 depending on your stack preference) to naming conventions that applications and cross-platform services and their gateways need to consider. I'm really not interested in playing the network protocol wars again, but would prefer to concentrate on developing conventions that users and/or their applications can implement to facilitate seamless integration of their services and applications.

Glenn's notes address some of that and we can discuss things further.

1513. Frequency Usage

Yahoo group: DAWG-HSMM
Date: 2009-09-14 06:54:22 UTC
From: J. Gordon Beattie, Jr., W2TTT
Topic: 1474 Message: 1513

Glenn,

Shift of subject.one thing that I really need to do is to check how far we can really go on 2.4 WiFi these days.

Several years ago, we could go almost a mile with directional antennas and 18db/500mW bi-directional amplifiers.

Now, I think going several hundred feet is going to be an issue at 2.4 because of the number of systems in our area.

I did a simple one mile ride from home to church and found 100+ WiFi access points in addition to the very strong "public" access point operated on our main street by the local cable company. I'll need to check on the channel distribution of all these sites to see if this can be managed through channel selection.

We'll see!

Thanks & 73,

Gordon Beattie, W2TTT

For the Richardson Wild Ride, for two years now, we have had a router with a 19 db antenna connect 5 miles to a router with a 15 db antenna, and at the same time connect 10 miles to a router with a 24 db antenna. We were running horizontal polarity to cut down the interference, but it is possible to go long distance. The biggest issue for long distance is getting line of sight.

I intend to try to reduce the local noise by mounting the antennas on the top of tall structures like water towers. It puts them farther from home users, shields them from the closest ones (the new water towers around here have a flatter top), and gets the antenna high enough that you can see the next site 5, 10, or more miles away.

I have routinely made 8-10 mile connections from residential neighborhoods with 20+ AP's showing up, using the same antenna (at 20') and 400 mw power you mentioned. Our HSMM AP was up 300' on a tower and just barely "line of sight" through the trees using a 14 dB gain slotted waveguide omni antenna and 400 mw.

At my home I set up three typical consumer AP's in about a 50' radius around my HSMM dish at 20' and connected to another of our HSMM nodes about 6 miles away. I could only see a very slight decrease in data throughput when the three local AP's were turned on and streaming data, which really surpised me. The distant AP was only about "40%" signal strength on channel 3 on the Engenius ECB-8610, while the local AP's were "90%" on Channels 1 and 6.

This was on the W3EOC digital network in SE PA. I have since moved to NC ... and really miss the HSMM capability we had.

Steve,

Your experience is encouraging. I'm worried, though, because I detected 100+ APs on a route that probably had more APs that what I detected.

The density is probably 10 times what you experienced. The only way to know is to try it and then we'll know!

:-)

Maybe next weekend!

From: s_ahlbom
Topic: 1474 Message: 1517

Interference certainly could be an issue. Sometimes you just can't make the link! Due to our local terrain, we almost always had to use relay stations at a high spot, to get the signal down where it was needed. We often mixed D-STAR 1.2 GHz DD mode, 900 MHz Avalans and 2.4 GHz at the relay stations.

H polarized antennas do help reduce interference, unless there are strong first-order reflections off of metal structures from the local AP's (which "tend" to use V Pol.)

Higher gain 24dB dishes help reduce the local interference, but keeping them aimed when using portable masts is a challenge.

I found that changing the height of the antenna by just a few feet (up or down) will often make the difference between a solid and marginal link. Fifteen feet is usually the minimum height for more than a few miles. Above 25' the mast is too wobbly, unless guyed.

Accurate vertical elevation aiming of the dish causes many problems for newbies. And it is important to make sure your center feed is still in the center. I marked an X in the center of the feed housing and measured from the four corner of the dish to the X to verify it is still reasonably close. Mesh dishes can suffer all sorts of torture when getting hauled around and need frequent "squaring up".

1518. Re: ISO 6523 Naming for Networks, Services and Applications

Yahoo group: DAWG-HSMM
Date: 2009-09-14 15:37:14 UTC
From: whwallacemo1
Topic: 1474 Message: 1518

I want to suggest to our ARES group that we look into several HSMM "client" subsystems (AP's) and several "Relay" subsystems, each built by an individual member. I am leaning towards 3 or 5 GHz, but that is unimportant. Upon need we would deploy those to set positions depending on the needs of the served agency, but preplanned points for each agency. For example, If Agency X calls for support, we would deploy to preplanned map/building rooftops, etc. locations for the "Client" subsystems and preplanned map locations for the "Relay" subsystems to make the circuit. Hopefully all tested and exercised before hand.

Does anyone have any ideas of is it important to have naming conventions for subsystems at this level or should be just go with our call signs for each subsystem. What problems am I going to run into with this network topographical philosophy?

Any help, suggestions, criticism, would be appreciated, as I am still learning.

I would try it. What you detect driving around and what you see at the two locations are different animals.

In Austin, Glenn has a link that crosses the University of Texas Campus. UT probably has the densest configuration of WiFi on every channel you could see but because they are indoors, and have the standard antennas, and are a couple of miles from either link, it is not a problem.

1520. Re: [ntms-hsmm] Frequency Usage

Yahoo group: DAWG-HSMM
Date: 2009-09-14 16:16:18 UTC
From: Glenn Currie
Topic: 1474 Message: 1520

From good locations in the Austin area (good line of sight with clear Fresnel zone) we can, at will, make solid connections simply using 24dB BBQ grill dish antennas on otherwise unaltered Linksys routers.

In a relatively RF quiet area, AD5OO has demonstrated that our mesh nodes (no amps) linked at over 7 miles with 11dB omni antennas.

BDAs have only proven useful in overcoming long feed line loss, in our experience. I am sure there are a few other special cases where they would come in handy.

So please help spread the word that slapping a BDA on these radios is usually not needed and is not useful. You simply add to the spectrum pollution.

Our testing of the WRT54G routers over downtown Austin included shooting over the heavily student populated area of the west U.T. campus area where we shot through / over THOUSANDS of 802.11 wireless devices in addition to countless microwave ovens. Absolutely no problem at all with the right gear. You either have a good path or you do not so getting good feel for spread spectrum microwave propagation is an important education issue.

The microwave RF physics has not changed just because we have gone digital. We can survive more noise with the new digital systems and recover from errors better than we could in the past.

We have done field testing for about 8 years now. I personally own a microwave relay van with a 41' pneumatic mast so testing is pretty quick and easy. You only need a hint of a signal, a few dB above the noise floor to make a link.. It is always nice to have a bit of margin, but if you need more than 1/2 watt for most links you need to find a better path or temporarily run enough power to burn a hole in what is in the path to create LOS ;-).

Check the noise floor with your two directional antennas staring down each others throat before running more power. So far, our longest link with completely unaltered WRT54 routers with just good antennas is just a bit over 15 miles. At this distance the digital ACK timeout counters start trying to resend the packets at times as they expected the Time Of Flight across the house to be less than that of a 30 mile round trip delay.

For a real mesh you want omni antennas and lots of nodes, but again you keep the power low. So for both point to point and mesh "illumination" of an area, power is almost never the answer.

Check your signal strength with a path study.

I have seen data being passed with 12 Access Points on the same channel in an apartment complex in the west U.T. campus area. There were lots of collisions and re-sends, but none of the users seemed to have noticed as their effective

throughput was fine.

We can usually EASILY operate in the shared ISM band with millions of 802.11 devices in the world. You just have to get out and do some field work and see how profoundly noise immune these systems are.

The great success of these systems being used by people that usually know noting about RF is due to the fact that the systems are so profoundly robust. Otherwise clueless users would always be taking the gear back and asking for the money back. So that non RF savvy users get such profoundly dependable service out of the systems it quite telling.

We have not changed the laws of physics. There are situations where you can get interference that is not easy to work around, but in 8 years of field work, I have NEVER found a place were I could not put my signal where I wanted it, with a bit of work and proper antennas, VERY carefully aimed.

Glenn,

Shift of subject.one thing that I really need to do is to check how far we

can really go on 2.4 WiFi these days.

Several years ago, we could go almost a mile with directional antennas and

18db/500mW bi-directional amplifiers.

Now, I think going several hundred feet is going to be an issue at 2.4

because of the number of systems in our area.

I did a simple one mile ride from home to church and found 100+ WiFi access

points in addition to the very strong "public" access point operated on our

main street by the local cable company. I'll need to check on the channel

distribution of all these sites to see if this can be managed through

channel selection.

We'll see!

Thanks & 73,

Gordon Beattie, W2TTT

1521. Re: [ntms-hsmm] Re: ISO 6523 Naming for Networks, Services and Applications

Yahoo group: DAWG-HSMM
Date: 2009-09-14 16:29:35 UTC
From: Glenn Currie
Topic: 1474 Message: 1521

All good questions.

We went to a tremendous effort to expand the address space in our release 3 firmware for HSMM-MESH. You call sign gets burned into the mesh node when as part of the HSMM-MESH firmware load so IT is automatic.

With HSMM-MESH no further naming conventions are needed. You turn the systems on, aim the antennas and they will be passing data within 5 seconds of coming into RF range, with no other user intervention due to the OLSR firmware we have added.

You have the same basic idea we have for supporting served agencies.

Once you have a basic link point to point for an agency, you may wish to hang a Part-15 AP off the back of one of the mesh nodes, turn on WEP to keep unauthorized users out, but at that point the served agency will see a standard access point.

You are obligated to monitor the traffic to make sure it meets FCC rules and regs, but most traffic generated by served agencies would seldom ever have any questionable content, and you are done.

Our HSMM-MESH firmware is free. You load it instead of loading an update for the Linksys firmware.

There are other workable ways to run Part-97 with the wireless routers, HSMM-MESH is just something I have been working on for 8 years, so it is what we use here in Austin. The Dallas / Plano area HSMM group has a lot of field work under their belt and they seem to like the addition of our mesh capability and have been a big help in furthering its development. But to be clear, there are other ways to do these links but then you have to sort out all the questions you asked, and HSMM-MESH just takes care of them, if I understood your questions and application, correctly.

From: Glenn Currie
Topic: 1474 Message: 1522

Quite right.

In one of my presentations I did some "war driving" for the U.T. area
we were shooting across and during the presentation one of the hams
said, "look at that, they are thicker than flees!". Yes and the point was
exactly what Kip pointed out. Due to the relative signal strength, the
10 mile shot across the area was a piece of cake, that required only the
time to set up the gear and aim the antennas.

Please help spread the word. Yes there are MILLIONS of the Wi-Fi devices
out there and most if not all of them are potential ham radios. The are cheap.
The lack of inteference is by design and pretty non intuitive, but works like
gang busters.

We can work right in the shared ISM band with good RF knowledge and seldom
using amps and do all we need to do.

It took me a while to believe it, but the field results are quite consistent, and we
are now getting in more field reports that support the claims. This is the deal
of a lifetime for hams. Jump in and give it a try! The more of you out there, on
the air, the more fun it is!

1524. RE: [ntms-hsmm] ISO 6523 Naming for Networks, Services and Applications

Yahoo group: DAWG-HSMM
Date: 2009-09-14 19:06:16 UTC
From: Dave
Topic: 1474 Message: 1524

I run UI-View with InfoKiosk and was thinking it be of great value to HSMM effort if we could do an add-on app that showed HSMM/mesh network as part of the map? That way we could overlay an existing APRS status display with HSMM info without having to use an APRS transmitted at each antenna location. An image editor allowing an object to be created without having a transmitter...

It would be a very minor issue to add an HSMM icon to UI-View icon text file, and maybe just as simple to be able to add a fixed point to a map (because HSMM may *eventually* have an APRS identifier with it, but won't unless we add another level of tech to it). It could be that a full-time internet link would be able to upload the position.

Maybe someone who programs can understand how to change the UI-View icon data to show an HSMM station that can be fixed to a map? Seems simple enough.... new icon/text files are being created as they are needed. We need an icon in APRS.

Subject: RE: [ntms-hsmm] ISO 6523 Naming for Networks, Services and Applications

Yes,

For a variety of reasons, having ways to be more cleaver about how to traverse
an enormous address's space will pay dividends in better response.

We are looking at ways to make the best use of APRS messaging, and possibly add messages for mesh status.

There was an article in QEX a while back by Mitchell where he showed how he had integrated a wide variety of digital ham modes.

As for D-STAR, EchoLInk etc. we need to do our best to blend them together. Recently Bob, B. the inventor of APRS proposed a universal text message scheme
for ham radio. I am still pondering the implications.

I am interested in fast smart routing so when we can use our fixed and mobile mesh
nodes in a store and forward way to pass data, we have an efficient system. Some
sort of tagging could bypass a brute dumb, brute force method of linking.

Lots to think about, thanks for pointing out the previous efforts in this area.

We hams (at least some of us) really get on all the different government agencies to
work out better interoperability. We have plenty of our own interoperability within
ham modes to keep us busy for quite a while.

If the data / message every goes through a server, we should have some way to
cross link it to whatever other modes make sense. Sending live video as short APRS
messages just does not sound like a good idea just due to bandwidth considerations,
but many of the major digital modes remain "islands" in a digital sea and we should
do what we can to cross link them, and some sort of tagging system at a higher
level than IP could be used to sort it out.

Lots to think about.

Glenn,

IPv6 is the right answer, but I was thinking, as you hinted, that we may

want to consider it for what rides above it, so that we don't need to

resolve IPv6 addresses associated with specific applications and services

manually.

We might consider integrating the interoperability controls into the naming

at gateways for instance, and knowing the application name and domain in

which it rests may be useful. For example, even when there is no radio

involved, Echolink wants validated users or service points, so if we

parceled out a service name that implied Echolink, then it would be able to

autonomously determine who gets naming space in their world while also

enabling those who are so "blessed" to seamlessly integrate their systems.

So (heresy to follow) if we wanted to allow Echolink to IRLP to DSTAR

integrated networks or integrate any of those with other networks or

application services, we would have a way to indicate to our edge gateways

(application or service and not necessarily network gateways) how to carry

the transaction or other communication.

Read on and we can discuss it some more when we all have had some time to

brainstorm a bit.

Thanks & 73,

Gordon Beattie, W2TTT

Lots of new stuff to consider as new horizons open up.

Most of the world is going to IPv6 - eventually. But there is an almost

infinite

number of things you can layer on top of it.

Thanks for the pointer I have down loaded it and will check it out. There

is

a lot of stuff form the old TexNet packet system that we still discuss as

well.

Hi Folks!

Here is an idea that may be useful for structuring network element and

service or application identifiers for Amateur Radio.

Years ago, this was something that was cooked up to get us past the IP

address space and broaden the naming conventions that we might choose to use

within Amateur Radio. It was always thought that the old "protocol wars" of

Amateur Packet Radio needed to be transcended and this was an intellectual

product that may be useful in a broader context. With HSMM introducing

notions of Hinternet and Internet interoperability, we might want to take a

look at this coding scheme for our HSM networks, services and applications.

Check out Code "0011" in the ISO 6523 document and perhaps we could start a

dialogue on that either here or elsewhere.

WIFI RF 'clutter' is not the issue around here...weather and trees are our problems

We have a huge problem every time we get some precipitation...and we get a lot. Does not even need to be heavy, just a little mist or fog will cut a link.

With 100 foot tall fir trees all over the place, getting a clear LOS is very hard....and never
were you need

Slowly (very slowly) learning about this stuff and hope to get at least one or two others to play
with it to figure out what we can do with it around here

From: Glenn Currie
Topic: 1474 Message: 1528

We are running the OLSR plug in code written for open-wrt firmware for
the WRT54G as part of the masters thesis of Andreas Tonnensen.

<http://www.olsr.org/?q=background>

Andreas looked at all the 3 rd party firmware platforms and found the design done
by the open-wrt to be prefferable for his use for several reasons, such as the plug
in feature. That is why we went with open-wrt - no need to reinvent the wheel - too
much other value added ham radio stuff needed.

We have experimented with various releases of the OLSR code as they come out,
but it would take a long time to describe all the types of testing we have done.

We will move to later versions of OLSR, if they are helpful in our view, in later
releases of HSMM-MESH firmware.

But we have made many other changes as well, not just adding OLSR so answering
your specific OLSR question may not actually answer all your questions.

In the Austin case are you running straight OLSR RFC-3626 or has it been modified somehow?

1529. Re: [ntms-hsmm] OLSR Question.

Yahoo group: DAWG-HSMM
Date: 2009-09-15 00:25:25 UTC
From: Glenn Currie
Topic: 1474 Message: 1529

Thanks for the info. I used to help with commercial microwave links decades ago, carrying ABC network TV feeds from Corpus Christi, TX to Victoria TX, through 3 relays between the towns. We had a lot of problems, thus learned a lot. (if all is running well at a commercial station, nobody wants you to touch anything!)

The ground fog on the Texas coast is often go so thick you literally could not see your hand at arms leangth in the day or with a flashlight at night.
That would shut us down about
10:45 - 11:00 PM every summer evening. Many other stories of trying to keep a small, marginally profitable UHF TV station on the air with a 1954 UHF transmitter.

Microwave links are much cheaper now and the consumer stuff has tremendously more bandwidth than the old expensive RCA stuff we used when I was a high school kid with a night job at the TV station.

The microwave links need specific conditions for propagation.

One thing I am trying to promote is portable, mobile and drive by use.

With a good link you can transfer the entire ARRL handbook in PDF format in about 35 seconds, so you don't need to hold a link for long.

We have done some interesting testing with "drive by shootins" of data transfers.

Even at 60 mph you can maintain a link between a moving vehicle and a plastic ammo box with a mesh node in it for almost a minute, after popping over the top of a hill.

With a bit more work on the antennas and a server locked and loaded with data, you could blast short video clips, files and whole novel size books between a mobile unit an a fixed unit. The current OLSR firmware will auto link you in about 5 seconds automatically. This is in the firmware and working now.

So there is some interseting work you can tinker with even if long links are a problem.

The academics and military have been tinkering with this for years. Google Diesel Net and you will find some facinating work that could be done with our mesh nodes.

So many projects, so little time. ;-)

-Glenn

WIFI RF 'clutter' is not the issue around here...weather and trees are our problems

We have a huge problem every time we get some precipitation. ..and we get a lot. Does not

even need to be heavy, just a little mist or fog will cut a link.

With 100 foot tall fir trees all over the place, getting a clear LOS is very hard....and never

were you need

Slowly (very slowly) learning about this stuff and hope to get at least one or two others to play

with it to figure out what we can do with it around here

Thanks Glen,

Thats exactley what I wanted to know.
From what I have read the Ubiquiti gear and be loaded with dd-WRT & OLSR.
It looks like another hardware path to explore.
I will let he group know more once I get something up and running.

Any one think about running a 44 subnet on these networks?

1531. Re: [ntms-hsmm] OLSR Question.

Yahoo group: DAWG-HSMM
Date: 2009-09-15 01:39:17 UTC
From: Glenn Currie
Topic: 1474 Message: 1531

I have some of the Ubuiqui radios but have not had time to
test them.

In addition to the OLSR code we have added a lot of unique
(non standard?) code to expand our original addressing scheme that
only allowed for 256 nodes.

Now 256 nodes was more than enough to hook up all the local hospitals,
but we thought the project might grow beyond that and that and therefore
put a great deal of effort in expanding the address range so I think most
hams in the U.S can now have a few addresses.

The key point is that OLSR alone - may not be enough to link with
our WRT54G based HSMM-MESH nodes.

They would link at the MAC level, but after the OLSR level 3 link level
code, might get lost.

Thanks Glen,

Thats exactley what I wanted to know.

From what I have read the Ubiquiti gear and be loaded with dd-WRT & OLSR..

It looks like another hardware path to explore.

I will let he group know more once I get something up and running.

Any one think about running a 44 subnet on these networks?

Subject: Re: [ntms-hsmm] OLSR Question.

WIFI RF 'clutter' is not the issue around here...weather and trees are our problems

We have a huge problem every time we get some precipitation...and we get a lot. Does not
even need to be heavy, just a little mist or fog will cut a link.

With 100 foot tall fir trees all over the place, getting a clear LOS is very hard....and never
were you need

Slowly (very slowly) learning about this stuff and hope to get at least one or two others to play
with it to figure out what we can do with it around here

1533. Re: [ntms-hsmm] OLSR Question.

Yahoo group: DAWG-HSMM
Date: 2009-09-15 07:32:39 UTC
From: John Champa
Topic: 1474 Message: 1533

Greeting!
In the many deliberations of the old ARRL HSMM WG we tried to grapple with this almost counter-intuitive phenomenon Glenn and Kip describe so well by giving it a name:
"The Proximity Effect" .

In simple words, the WLAN router "sees" it's clients and primarily only its clients
because they are nearby, they have the strongest signals, and its *transmit / receive *
capabilities with the standard WiFi rubber duck are extremely limited, falling off
very quickly with range (by design). So is the range of the average laptop with built-in
antennas. A weaker signal passing by (essentially passing overhead) gets ignored because
it is too weak to associate....except at the distant end where at that point using a high-gain
directional antenna, it is now by far the strongest signal.

Confusing, I know, and I am probably not explaining it nearly it as well as the physicists
on the old WG did. But as Glenn and Kip state, it works, and works extremely well too.

Try this. Instead of "war driving" (not appropriate phrasing for Ham? ;o) Hmmm...OK, do an RF Area
Survey (HI). But in place of the omni-antenna, instead use a highly directional gain antenna such
as the inexpensive MFJ-1800 on a camera tri-pod. As the antenna is slued through 360 degrees you will
observe many, many WiFi nodes, but not all at once. Usually only one or two at a time as they pop
in and out of your directional beam. Most are on channel 6, the mfgr's default channel for many
models. They cannot (for the most part) detect the presence of the each other because, again, of their extremely limited range capabilities.
However, you can see them all, at least those within in range of your antenna. Perhaps a better term might be antenna selecting?

I had better quit while I am ahead (maybe ;o).

Hope that helps!

73,
John K8OCL

1535. RE: [ntms-hsmm] ISO 6523 Naming for Networks, Services and Applications

Yahoo group: DAWG-HSMM
Date: 2009-09-15 00:48:27 UTC
From: Glenn Currie
Topic: 1474 Message: 1535

We are working on something like this which is based on the
"dot-draw" plug in for open-wrt.

<http://d.yimg.com/kq/groups/17395913/homepage/name/955244?type=sn>

It provides a dyamic map of currently visible mesh nodes.

So many projects, so little time.

I run UI-View with InfoKiosk and was thinking it be of great value to HSMM

effort if we could do an add-on app that showed HSMM/mesh network as part of

the map? That way we could overlay an existing APRS status display with HSMM

info without having to use an APRS transmitted at each antenna location. An

image editor allowing an object to be created without having a

transmitter. ..

It would be a very minor issue to add an HSMM icon to UI-View icon text

file, and maybe just as simple to be able to add a fixed point to a map

(because HSMM may *eventually* have an APRS identifier with it, but won't

unless we add another level of tech to it). It could be that a full-time

internet link would be able to upload the position.

Maybe someone who programs can understand how to change the UI-View icon

data to show an HSMM station that can be fixed to a map? Seems simple

enough.... new icon/text files are being created as they are needed. We need

an icon in APRS.

Dave

Subject: RE: [ntms-hsmm] ISO 6523 Naming for Networks, Services and

Applications

Yes,

For a variety of reasons, having ways to be more cleaver about how to

traverse

an enormous address's space will pay dividends in better response.

We are looking at ways to make the best use of APRS messaging, and possibly

add messages for mesh status.

There was an article in QEX a while back by Mitchell where he showed how he

had integrated a wide variety of digital ham modes.

As for D-STAR, EchoLInk etc. we need to do our best to blend them together.

Recently Bob, B. the inventor of APRS proposed a universal text message

scheme

for ham radio. I am still pondering the implications.

I am interested in fast smart routing so when we can use our fixed and

mobile mesh

nodes in a store and forward way to pass data, we have an efficient system.

Some

sort of tagging could bypass a brute dumb, brute force method of linking..

Lots to think about, thanks for pointing out the previous efforts in this

area.

We hams (at least some of us) really get on all the different government

agencies to

work out better interoperability. We have plenty of our own

interoperability within

ham modes to keep us busy for quite a while.

If the data / message every goes through a server, we should have some way

to

cross link it to whatever other modes make sense. Sending live video as

short APRS

messages just does not sound like a good idea just due to bandwidth

considerations,

but many of the major digital modes remain "islands" in a digital sea and we

should

do what we can to cross link them, and some sort of tagging system at a

higher

level than IP could be used to sort it out.

Lots to think about.

Glenn,

IPv6 is the right answer, but I was thinking, as you hinted, that we may

want to consider it for what rides above it, so that we don't need to

resolve IPv6 addresses associated with specific applications and services

manually.

We might consider integrating the interoperability controls into the naming at gateways for instance, and knowing the application name and domain in which it rests may be useful. For example, even when there is no radio involved, Echolink wants validated users or service points, so if we parceled out a service name that implied Echolink, then it would be able to autonomously determine who gets naming space in their world while also enabling those who are so "blessed" to seamlessly integrate their systems.

So (heresy to follow) if we wanted to allow Echolink to IRLP to DSTAR integrated networks or integrate any of those with other networks or application services, we would have a way to indicate to our edge gateways (application or service and not necessarily network gateways) how to carry the transaction or other communication.

Read on and we can discuss it some more when we all have had some time to brainstorm a bit.

Thanks & 73,

Gordon Beattie, W2TTT

Subject: Re: [ntms-hsmm] ISO 6523 Naming for Networks, Services and Applications

Lots of new stuff to consider as new horizons open up.

Most of the world is going to IPv6 - eventually. But there is an almost infinite

number of things you can layer on top of it.

Thanks for the pointer I have down loaded it and will check it out. There

is

a lot of stuff form the old TexNet packet system that we still discuss as

well.

Subject: [ntms-hsmm] ISO 6523 Naming for Networks, Services and Applications

To: ntms-hsmm@yahoogrou <mailto:ntms- hsmm%40yahoogrou ps.com> ps.com

Date: Sunday, September 13, 2009, 8:24 PM

Hi Folks!

Here is an idea that may be useful for structuring network element and

service or application identifiers for Amateur Radio.

Years ago, this was something that was cooked up to get us past the IP

address space and broaden the naming conventions that we might choose to use

within Amateur Radio. It was always thought that the old "protocol wars" of

Amateur Packet Radio needed to be transcended and this was an intellectual

product that may be useful in a broader context. With HSMM introducing

notions of Hinternet and Internet interoperability, we might want to take a

look at this coding scheme for our HSM networks, services and applications.

Check out Code "0011" in the ISO 6523 document and perhaps we could start a

dialogue on that either here or elsewhere.

1537. Packet on WIFI

Yahoo group: DAWG-HSMM
Date: 2009-09-23 03:30:43 UTC
From: Bill V WA7NWP
Topic: 1537 Message: 1537

Ok... All the magic TCP data flow from a device like a a WRt54GL is pretty cool - but it's a little lacking the 'the ham factor.'

There's got to be a way, given we have the source, to easily tweak the setup and essentially turn it into a packet (KISS?) TNC and data radio. I know there are modes for monitoring the raw packets. If we had some way to generate our own frames (like AX25 only something more modern and practical) that we can send with the 54G (or ?) we could put the existing data/packet tools on top of this new data layer. This would bring back all the Ham fun of looking for DX packets, APRS, etc with a high speed yet cheap radio box. Maybe it could even be done without affecting the existing data modes...

How long is the SSID field? Maybe we would use that for data?

Bill,

I'm not sure I follow you're thought process here. Since the WRT54G is essentially a Linux box you could probably write some specialized software that would provide "packet like" applications, but I'm not sure why. The system is already using a standardized protocol (TCP/IP), which allows for any application to be applied over the physical layer. If you want to run existing packet type applications over the network you can. However, the significant benefit of the use of the WRT54G for amateur purposes is that it provides higher bandwidth and utilizes the TCP/IP protocol. This brings the potential for multi-media applications as well as e-mail, file sharing, instant messaging, and any other application that utilizes TCP/IP. Limiting the applications to "packet like" apps would be like building a twenty lane highway for a few cyclists. Why sell your Yugo to buy a Corvette and then drive 5 mph? Packet and especially APRS are alive and well, and fill a critical need. But HSMM offers the potential to take amateur wireless digital communications to a whole new level, and with it all kinds opportunity for innovation.

From: Ron Cole
Topic: 1537 Message: 1539

I think the 'Ham Factor' was the concentration on the underlying technology not the content of the message. Thats still there but its in the software which is not as easy to get at as a knob on the from of a radio was. With OLSR the system optimizes the network based on radio conditions which is very different from older Ham Radio operation. HSMM today is new territory and its a very different creature from the 25 year old 1200 baud AX.25, Lets embrace the change and move forward.

Hmmm..So can't we run UDP through a WiFi router if you configure it to pass the right port traffic? Once done, couldn't we create an IP-based form of APRS without going into a retrograde operational mode?

Thanks & 73,

The WRT54GL does nave two logic level serial ports

As Andy said, it is a little Linux Computer. If you wanted you could convert the Serial to RS-232 and then hook it to a TNC and have a program that converts the serial data to TCP/IP packets for wired or wireless transmission.

The ham factor?
We change the SW to make it a mesh.
We add antennas to make it travel 5 or 10 miles or more I have only gotten 10 miles with a lot of Signal to Noise Ratio to spare.

Some friends are taking two of my units with 24 db gain antennas and do a range test in the next week or so. With 70 mw of power they should be able to go 140 miles. I will be happy if they can do 50 miles. The biggest problem is getting line of sight for the range.

That kind of range with a device designed for home or office use? That is ham radio.

1546. Re: [ntms-hsmm] Packet on WIFI

Yahoo group: DAWG-HSMM
Date: 2009-09-23 04:58:17 UTC
From: Glenn Currie
Topic: 1537 Message: 1546

There are a very large number of very capable tools to make use of the mesh node technology.

Try downloading the free program WireShark and looking at the packets.

There is an overwhelming wealth of tools to do pretty much anything you want to with this technology, hams have just not been paying attention.

Also one key thing to keep in mind, these are essentially software defined radios and for someone that does not want to mess with computers, none of this digital stuff will be of interest to them.

We have the source code to all the key elements of the system. Our HSMM-MESH code will run on significantly more computers than Microsoft Windows so there is no shortage of computer hardware available.

All the many millions of 802.11b/g and some of the 802.11a radios can be used as Part-97 ham radios.

They are being modified and used by a very large number of technical people on the planet. Most are not hams.

So there is absolutely no shortage of ham mods that an be done. From my vantage point 99.99999999999999999999999999999999999999999999999999% of the situation is that hams have almost completely ignored the most popular radios in the world.

Try WireShark, NetStumbler, Kismet, and you will see what I mean. Lots and lots of ham like activity with almost no hams participateing. Let's see if we can improve the numbers a bit!

Ok... All the magic TCP data flow from a device like a a WRt54GL is

pretty cool - but it's a little lacking the 'the ham factor.'

There's got to be a way, given we have the source, to easily tweak the

setup and essentially turn it into a packet (KISS?) TNC and data

radio. I know there are modes for monitoring the raw packets. If we had some way to generate our own frames (like AX25 only something more modern and practical) that we can send with the 54G (or ?) we could put the existing data/packet tools on top of this new data layer. This would bring back all the Ham fun of looking for DX packets, APRS, etc with a high speed yet cheap radio box. Maybe it could even be done without affecting the existing data modes...

How long is the SSID field? Maybe we would use that for data?

There are two serial ports on the WRT54G. Hook one to a TNC and
you have a traditional packet gateway to IP radios.

There is an excelent article by Mitchell in the files section of this yahoo site
that show, in great detail how to do this and more. This and more has already
been done. Take a look at the Mitchell article in the files section and read about
history.

Bill,

I'm not sure I follow you're thought process here. Since the WRT54G is essentially a Linux box you could probably write some specialized software that would provide "packet like" applications, but I'm not sure why. The system is already using a standardized protocol (TCP/IP), which allows for any application to be applied over the physical layer. If you want to run existing packet type applications over the network you can. However, the significant benefit of the use of the WRT54G for amateur purposes is that it provides higher bandwidth and utilizes the TCP/IP protocol. This brings the potential for multi-media applications as well as e-mail, file sharing, instant messaging, and any other application that utilizes TCP/IP. Limiting the applications to "packet like" apps would be like building a twenty lane highway for a few cyclists. Why sell your Yugo to buy a Corvette and then drive 5 mph? Packet and especially APRS are alive and well, and fill a critical need. But HSMM offers the potential to take amateur wireless digital communications to a whole new level, and with it all kinds opportunity for innovation.

Please forgive my error. I belong to many groups and thought I was reply to
a post on the Austin HSMM SIG yahoo site.

There is a huge amount of information available on the Internet and even in
ARRl publications regarding the topics you mention. You would probably
enjoy reading the articles.

There is much that can be done with the HSMM gear and lots of ham customizing
going on.

I think the 'Ham Factor' was the concentration on the underlying technology not the content of the message. Thats still there but its in the software which is not as easy to get at as a knob on the from of a radio was. With OLSR the system optimizes the network based on radio conditions which is very different from older Ham Radio operation. HSMM today is new territory and its a very different creature from the 25 year old 1200 baud AX.25, Lets embrace the change and move forward.

1550. ranging? RE: [ntms-hsmm] Packet on WIFI

Yahoo group: DAWG-HSMM
Date: 2009-09-23 05:03:11 UTC
From: kevin asato
Topic: 1537 Message: 1550

Hmm.

Interesting question. Problem with WiFi is that using routing protocols, distance (range) is generally defined by hops between nodes. There is no linear measurement (feet, meters) inherent in things as "distance-vector" protocols. If there is an RSSI/RSL output on the WiFi chipset, then you can get a relative signal strength. Still not a distance/range. Remember, too, that since WiFi is a radio, there are numerous external influences (interference sources) that can change how far one can transmit and receive on any given day, hour, minute, . . .

The WRT54GL does nave two logic level serial ports

As Andy said, it is a little Linux Computer. If you wanted you could convert the Serial to RS-232 and then hook it to a TNC and have a program that converts the serial data to TCP/IP packets for wired or wireless transmission.

The ham factor?

We change the SW to make it a mesh.

We add antennas to make it travel 5 or 10 miles or more I have only gotten 10 miles with a lot of Signal to Noise Ratio to spare.

Some friends are taking two of my units with 24 db gain antennas and do a range test in the next week or so. With 70 mw of power they should be able to go 140 miles. I will be happy if they can do 50 miles. The biggest problem is getting line of sight for the range.

That kind of range with a device designed for home or office use? That is ham radio.

Ham Factor - hmm. Rewriting pieces of software to extract new/additional features from COTS gear. Physically hacking the hardware to increase physical separation of the WiFi nodes or to find a way to slide between existing WiFi transmit frequencies for increased connection reliability. All in the quest to pass messages (voice, data, video) reliably from one point to another. I'd say that's Ham Factor.

I've got a project in work (Netgear WGR614L (L as in linux)) that I am going to hack into. Might take a while as my day and night job of programming and integrating routers into cell phone and Land Mobile Radio networks takes priority. Oh, yeah. Everything is data there, too. First steps will be to take the box apart, add a header strip protection for a serial terminal, and a connector to replace the external antenna. Software replacement will be a bit longer as I need to study what's available and the hardware architecture.

Kevin:

I think if you will look a little further down this board you will find that all this has been done for you on the Linksys WRT54XX series of routers and others. There is complete source code from Linksys available, Rewritten solftware for the router is available also as well as several great networking programs. Linksys had to release all their souce code because the used Linix for their OS and under the General License Agreement, they released it all and for years people have been hacking it to death for Part 97 use. AD5OO has a most extensive webpage on this as well as others.

Reading the prior posts may not be fun. I know I did it recently, but you will get an indication of what already has been done.

Kevin:
you do not need a header strip for the router. use a cat5 cable from your computer to the router. They are all set up to do software uploads already. IE or Putty(available free software) gets you write into the router. No hardware changes needed. Don't even have to take the cover off.

I also do not understand why you would want to go back to a much slower, technology like packet for radio/winlink type stuff when you have internet type facilities and speed (Wifi 54 Mkbps and radio packed is 9600 baud at best). TTY? 15 baud is slightly slow, when these guys do a 10 page document in a couple of seconds....

But the project may be able to use all the help it can get and you sound like someone who could help.

Investigate the area and you will be amazed at what has been done already.. Keep in touch and ask questions Welcome

Actually, higher packet rates are possible with modems like the tnc3s
(http://www.symek.com/g/tnc3s.html
), but buying that would be like spending $1500 on a pactor III modem.
(And you'd also need to get a special radio to drive the tnc3s.) I
guess that 2m packet has its place for nonLOS links...

Bill,
That is great news! Thank you very much for the your effort in making the presentation.
Maybe HSMM will not remain Ham Radio's best kept secret for much longer (HI)

With the publication of Glenn and Lloyd's xtal mod,. slideband mod, xtal switch mod, etc. in the
next issue of *CQ VHF* magazine, we hope things really take off. For the first time Hams will
have an OFDM "spread spectrum" 2.4 GHz transceiver not on Part 15 channels, not visible by
any WiFi device we have found, and it's cheap too (HI).

I have some slides you are welcome to have, along with some presentations of others..
Just drop me a note off-line and I will forward them to you, if you wish (k8ocl@...).

Thanks and 73,
John K8OCL

From: Glenn Currie
Topic: 1537 Message: 1560

There is a lot of great stuff that can be done, inexpensively with HSMM gear.

That said, please realize that there are many, many different modes in ham radio, and HSMM is not everyone's cup of tea.

I wish I had more time and toy funds, as I have not found ANY aspect of ham radio that I do not find interesting - just not enough time and money to pursue them all.

Some folks just don't like messing with computers. I do it for a living and, believe me, I can see why they are unattractive to many. They can be very useful and interesting, when working, but at my day job, if they are working properly, they are not on my desk or work bench. Just keeping my own systems properly backed up, virus protected etc. is a time consuming, and I have hard disk crashes that are infuriating wastes of time, just like every one else.

On a positive side for the day job, as long as the hardware keeps breaking and the software always needs attention, I have work.

As for enjoyment, the computers can drive you crazy at times as they can screw up in countless ways - not my idea of fun.

But when you can get them working and get some cheap mass produced ham radio gear working in them, they can be very interesting. Right out of the box, if you run on channels 1 - 6 you can use a Wi-Fi device under Part-97 rules - that is, as a ham radio.

Hams often encourage the emergency services people to more fully integrate their communications systems for better interoperability. We we need to do this as hams as well, with all the different modes we have.

There was an excellent article by KL1Y in the March/April 2007 edition of QEX where he showed how he had integrated many digital modes. Remember some of the slower modes run on bands where the signal propagates very differently than on microwave. Some may be slower, but travel further with ease. Microwave has super bandwidth,but can be finicky with LOS requirements.
They are different tools and can fill a useful communications tool box.

Roderick D. Mitchell, KL1Y wrote the article:

The Integration of Amateur
Radio and 802.11
Amateur Radio and 802.11 wireless networking —
a good fit for emergency message delivery.
Roderick D. Mitchell, KL1Y

Where he shows cross linking traditional packet radio, Winlink 2000 and 802..11 based radios in one radio "system". I HIGHLY recommend the article. What he did could have been done years ago, but he actually did hook all this stuff up and

made it work and published an article on how to do it, in an ARRL publication.

So if you are looking into how to link packet and 802.11 etc. you would do well to read this article. The man really knows his stuff.

Try OpenFire or TeamSpeak... Much better and easier to install. Both have video, chat, text, conferencing, voice. I run a system here and use it all the time. Easy to use. I suggest a standard platform be developed and we can put everything on one CD and distribute it; proven technology, setup screen, instructions and it works. Nothing *wrong* with you suggestion, just that these two, specifically OpenFire is great, proven tech.

Bill,

Thanks for the advice. I have already gone through some of the prior work on this list and also through myopenrouter.com and am familiar with some of the work going on there.
The Netgear hit a particular price point with me ($50) and I just wanted to hack both hardware and software of a slightly different platform. Just one of my quirks.

I like to use a (keyed) header strip to keep things neat on the inside (also passes spec when going through airports with this unit tucked into my backpack - TSA hates loose wires hanging from boards!). Also adding 3.3V zener diodes to protect the RS-232 pins which are at the low power end of the TTL spec, then determining what is needed to keep the unit battery powered (how low can you go?, even POE). Then on to see what is required to host new software features. I'm not worried about time as this is to be a leisure time activity in my copious amounts of spare time these days (I am lucky as I have family obligations and 50-60 hour work weeks). I do plan on documenting the work as I proceed. It just may take a while. Then again, isn't this what it's all about?

73,
kevin
kc6pob

The serial port would be my debug port. There will be times when there are issues that will not be visible from the Ethernet connectors. Least that is what I am expecting. My bias is working in a development and integration environment where one uses any means possible for gaining visibility into a system.

"First steps will be to take the box apart, add a header strip protection for a serial terminal, and a connector to replace the external antenna. Software replacement will be a bit longer as I need to study what's available and the hardware architecture"

Kevin:

you do not need a header strip for the router. use a cat5 cable from your computer to the router. They are all set up to do software uploads already. IE or Putty(available free software) gets you write into the router. No hardware changes needed. Don't even have to take the cover off.

Do not forget that on the WRT54GL 10 pin header there are 2 serial ports. tty0 is defaulted to a console port. I am not sure about the other, tty1.

I know the conversation has moved away from this idea, but just an FYI, I did a quick rip through the DDWRT code last year thinking about this same idea, and there really isn't a place to patch in and just use the radio without the IP handling. As best as I could determine, a lot of the IP framework is in the hardware and not able to be easily bypassed by the firmware.

1570. [Fwd: Sale Announcement]

Yahoo group: DAWG-HSMM
Date: 2009-09-24 14:33:28 UTC
From: Kilgore
Topic: 1570 Message: 1570

```
-------- Original Message --------
Subject: Announcement
Date: Thu, 24 Sep 2009 08:01:42 -0500
From: Robert <w5@...>

Please assist in communicating the following announcement to local hams;

This Saturday, 9/26 from 7:30AM - 12:30PM, W5IUA and N5IUA will have a
garage sale in Parker, the address is 4307 Countryside Drive. W5IUA
was laid off from his job last week, and extra cash from the sale
proceeds will come in handy. The sale will include numerous ham radio
and computer items.

Thanks & 73...Robert
```

any decent dual band mobile or dstar gear or an FT857 ?? I need to get
my new vehicle loaded up with radios :) If you got any of this, I'd like
a chance to get at it before the weekend.

I guess this is why we are trying to get a public web site up and running for these types of inquiries. We can direct them to the new site and we can use this site as a developmental coordination site. When we get the new site up, we will all have to remember to direct inquiries to the new site and we will not have to bother anyone to allow access.

I have added more to the web site last night. I am beginning to add the information someone asked for concerning adding the software and instructions for using it over to the public site. Some additional information has also been added. TAKE A LOOK AT IT. WWW.IM4EXYZ.ORG Soon I am going to be porting the actual software over. The shell is already there to hold it. I already have the instructions over and that is the reason for the next paragraph.

I am becomming concerned that some of the information on the wiki is 2 or 3 years old and conflicts with newer instructions. I would appreciate it, if you put something on the wiki before, please take a a minute to look at the wiki and update any information you provided to the most current conditions, configuration information, suggestions, etc. Version 3 does not have "Documentation" yet. Please, if you update any information on the wiki, let me know about it, and I will move it over to the new public web site.

I have also started a project to identify appropriate software for VoIP, Video streaming, e-mail, and file transfers. I am collecting and analysing data from searching the internet stage. If anyone has any comments start a new topic and help me.

Thank you

Bill W KC0TGY

Thanks; good job. The group needs to have a place to call home and place instructions, etc.

Take a look at Openfire/Spark and TeamSpeak. Openfire/Spark allow VoIP, conferencing, multiple video.. Etc. TeamSpeak is a really nice VoIP app. PHP and easy to run, install, admin.

Thanks Dave. I will look at them tonight.
Someone needs to get out front over the developers and have some software set up to run on HSMM-MESH (trade marked) when they are finished. When they get finished with the hardware, I want to have something that will work to drop on top of it that works for the "Served Agency". At least, the effort will give them something to look at and take exception to.. then make it better.

Yes,

We need to get the public web site up soon. It would be most helpful.
The request for review of existing information on the wiki is understandable.

The basic information on the version 3 HSMM-MESH code is pretty current. There
is a quit a bit of older stuff on the wiki, but the instructions on loading the version 3
firmware is in pretty good shape, I think.

Dealing with all the informaiton we have collected over the last 8 years is quite a task.
I currently have a 64GB USB memory stick on a lanyard around my neck that is
almost full and it is all HSMM related information thath needs to be fleshed out,
or the context to the project explained and shared.

I will make an effort to review the version 3 HSMM-MESH firmware documenttion. If
we get that and the binaries posted that will be a big help.

I am alreasy supporting multiple users in multiple states and it is hard to find the time
to do so, but it seems wrong to stir up interest then not follow through with enough
help to get them on the air.

Lets get the basics checked out and ge the public web site on line as soon as possible.
We can always add to to it but we already have over 50 people on the Austin development
yahoo site and it is not the best place to be directing everyone. We need the pubilc
site up as soon as resources allow.

Thanks for your efforts.

I can't wait till be have a fully described arch from which we can run a single disk, minimal user interaction except to select the OS, and then it's up. As in the military things go bad in the heat of battle and it will also be the case with HSMM-Mesh. A complete disk with everything on it, and documentation on setting up a -small- will be needed for ham guys; not needed for computer folks. This is simple stuff, even Mesh. I'm going to try it soon, at a big festival here in Pueblo, CO where we could set up, say, five points and cameras plus SSTV radio and see what happens. Neat stuff -keep going.

I'm thinking about a system from FAB-CORP: The EZ-Bridge-Lite□ comes complete with all the electronics that are needed for a point to point wireless network bridge installation; including 2 powerful 14dBi antennas with built-in 802.11bg high power electronics, Bracket Kits which accommodate pole or wall mounting, Cat5e rated POE (Power Over Ethernet) power inserters and 18VDC auto-ranging power supplies. Customer needs to supply CAT5 cabling between the power inserter and the antenna.

Sounds like the full setup... Any one have experience with an EZ-Lite system and HSMM-Mesh?

HSMM-Mesh is currently only supported on particular versions of the
wrt54g*
routers. So, you'd be blazing a new trail with the ez-bridge.

HSMM-Mesh has value-added-software added to openWRT. So, if openWRT can
run on ez-bridge, then you *might* be able to port HSMM-Mesh to ez-
bridge.
However, I don't see ez-bridge listed in the supported section of the
openWRT
website; it also isn't listed in the unsupported hardware for openWRT
either.

I think it'd be safer (though perhaps not simpler) to get a wrt54g*
router,
and a rootenna... make a few mods to the router (power over ethernet)
and
then you're good to go. Fab-corp even sells a 15dBi antenna. ;)

Then once you're familiar with the software, you can try branching out
with
other hardware. Porting software to new hardware can be a headache,
however.

From: WILLIAM WALLACE
Topic: 1575 Message: 1583

David, Can you keep a log book of everything you do at the event and then send a copy to me or put your experience on the Yahoo or wiki site?....
This is a great test and to see the following would be invaluable to me setting up the web site.

Hardware used

Configuration of hardware, firmware, and auxiliary(application, server, video link, everything above HSMM-MESH) software generally

1. what went wrong? How did you fix it?
2. what went wrong? How did you fix it?
3. what else went wrong? How did you fix it this time?
Who used it and what did they use it for?
What was the response you received?

Also get pictures of everything.... All these answers and pictures will be very helpful for the Hams learning this technology...
OK if you get everything I want, you will not have time to set up the network and get it running, but it does not hurt to ask does it?

Bill Wallace KC0TGY

1587. RE: [ntms-hsmm] Re:-- longtermbond wants to join ntms-hsmm

Yahoo group: DAWG-HSMM
Date: 2009-09-28 03:11:26 UTC
From: Glenn Currie
Topic: 1575 Message: 1587

It is always risky to comment on a system one has not worked on, but a "bridge" system typically means a particular type of point to point link. It takes the place of a long CAT-5 computer cable - period.

Now is a useful thing and is used in many places, but differs significantly in the architecture and intent of a mesh. A bridge usually links two points and two points only.

A mesh has software, in the case of HSMM-MESH, to dynamically add links for more connections. Additionally, if you have multiple mesh nodes in a mesh and a user of one node is passing a file to another node, through an intermediate node, and the intermediate node fails, the data is automatically switched to another path through other mesh nodes.

The military likes mesh nodes because if you put a bunch of nodes in an area and some fail data continues to flow as the mesh dynamically reroutes the data.

In a simple bridge , if the link breaks, there is no provision to switch to another path.

This is accomplished by the Optimum Link State Routing OLSR code that has been added to the HSMM-MESH code.

Now if you just have 2 mesh nodes and one breaks, then the link is broken. In the military, they literally fly over and drop thousands to mesh nodes in an area and if many of them are disabled, they simply fly over an pepper the place again.

So I am assuming (dangerous) that the bridge system mentioned is a simple pair of radios that pass data. If you had a third, similar radio, for example, most bridge designs have no provision to make use of the third radio. Their link design is just a very simply one.

So there are a lot of assumptions I made, but the key difference in a mesh is that it is expected that there will be multiple nodes and hundreds of them can be in one area and all will auto link. With a basic bridge, you simply replace a long wire with two radios and there is no straightforward way to add more radios.

There are, of course, many hybrid designs, that mix and match characteristics of different types of links. We would need to carefully examine the manual for the radios, but I would expect no straightforward way to make bridge devices mesh. A mesh is a much more complex design.

There are plenty of uses for bridge links. There are thousands of them in use as I send this, but a bridge is generally a distinctly different software architecture than a mesh.

Hope this unresearched speculation is of some value.

I know what HSMM-MESH does, I do not know what this particular bridge hardware/ software combo does. I suspect if they could mesh, they would advertize it.

-Glenn

There are 1 or 2 places that ARES-MESH is mentioned in some of the
documentation

I did not find a "Documentation" label like is under Version 1 and 2

Maybe they are somewhere else and I just did not recognize them for what
they were.

> Dealing with all the information we have collected over the last 8
years is quite a task.

I need this, Why the project? I know you used Wifi in controlling some
of your Robots,

But there has to be more. Maybe someone else from the old ARRL Working
Group set it

off, but I would like to know how this project got started. Plus who are the developers?

When questions come up from the Web page, I don't want you to have to piece out the

questions for somebody to answer, I would do that and get the answer to send back to

whomever asked the question and begin to build a Frequently Asked Question page or

Develop a Knowledge Base type of resource for our users.

>

> I will make an effort to review the version 3 HSMM-MESH firmware documentation. If

They will be posted soon. I have to copy each one of them to the web page so they can be

downloaded like they are now on the Wiki. It was too big a project to start at 2:00 am.

>

> I am already supporting multiple users in multiple states and it is hard to find the time

I want to know who they are? What are they doing with the software/firmware. Give me a contact for each of them and I will do the inquiry and document what I find out so people who use the public site can see that this technology really can be used in the real world.

>

> Lets get the basics checked out and get the public web site on line as soon as possible.

Thanks for your efforts. Thank you Glenn for putting up with pushy me. I know you are

overworked, but not over appreciated. I will get the site up, but as I said, I need help and

I appreciate your support. Thank you for your work on this project and that also goes to all

the developers. You ALL have done a real service toward revitalizing the Ham Radio experience

and hopefully drawing in more members to this wonderful hobby.

Glenn et al,

EZ (http://www.fab-corp.com/manufacturers.php?manufacturerid=13) did mention they are Mesh-capable, saying "Multiple EZ-Bridge-Lite□ units can be connected in a mesh configuration to allow interconnecting more than two sites." http://support.e-zy.net/EZBridgeLite/EZ-Bridge-Lite_DataSheet.pdf

I asked for clarification and will see what their engineers say about mesh-ing, but, you are correct about bridging being considered point to point. However, OSLA fail-over is a function of link-status monitoring applications based at each node that senses the connection status and reroutes by prearranged routing tables should one link break they all share that IPTABLE. The two I'm familiar with are, simply, data/packet backup sensing or signal loss failure. Take your pick, they both operate in about the same time frame. Node PC's monitor link delay status and reroute accordingly.

Mesh networking means, of course, that each site has to have two or more antenna/radio systems or some form of multiple auto Az/El on multiple antennas. Not sure how it would work as distance is dependent upon antenna power, design and altitude. Omni-directional antennas decrease effective area, so Yagi's or high-gain antennas are needed over 4 miles or so. Three antennas with auto switch-over is preferable in a dangerous environment but two fixed antennas in addition to the primary route would be sufficient, maybe. We need to know what antenna?

In our environment, as I see it, we would attach our antennas to a tall building, co-locate our Node equipment within CAT distance and route data, video, and text for an 'area operations' as required. We're providing limited PTP backbone service as I see it. Mesh is nice, we should plan our system on using it, but we also have to recognize that each mesh node requires another operator and system. Additionally, we are insinuating that we will probably co-locate with a ham station. I run a station not all that untypical that has beaconing, SSTV, Ecomm, RMS, and Paclink, weather and repeater; a lot for sure but we can expect a similarly featured ham station close to us to route long-distance communications.

And that brings up another question I am struggling with. Is HSMM and Ecomm in general, an inside-the-disaster zone communications system; an outside-to-inside zone system, or an inside to outside (traffic control) zone system? Or all the above? Who will regulate our data stream and client/consumer use if we are accessible to outside internet users? What is our interface with Ecomm? Are we the short-distance link between, say, the firefighters on the line (?) and the Fire or Police Station and ham radio HF the long-distance link?

If we're having trouble getting point-to-point we'll maybe have a more difficult time getting mesh operators.

I think a pursuit of PTP and planning for mesh as an option but not primary system is our best approach. Maybe. When, or if, the balloon goes up a mesh will be required someplace, so.. As long as it ain't super-EMF.

What's the Mission Statement and Purpose Statement and then we can built whatever we want.

It is always risky to comment on a system one has not worked on, but a "bridge"
system typically means a particular type of point to point link. It takes the place of a long CAT-5 computer cable - period.

Now is a useful thing and is used in many places, but differs significantly in the architecture and intent of a mesh. A bridge usually links two points and two points only.

A mesh has software, in the case of HSMM-MESH, to dynamically add links for more connections. Additionally, if you have multiple mesh nodes in a mesh and a user of one node is passing a file to another node, through an intermediate node, and the intermediate node fails, the data is automatically switched to another path through other mesh nodes.

The military likes mesh nodes because if you put a bunch of nodes in an area and some fail data continues to flow as the mesh dynamically reroutes the data.

In a simple bridge , if the link breaks, there is no provision to switch to another path.

This is accomplished by the Optimum Link State Routing OLSR code that has been added to the HSMM-MESH code.

Now if you just have 2 mesh nodes and one breaks, then the link is broken. In the military, they literally fly over and drop thousands to mesh nodes in an area and if many of them are disabled, they simply fly over an pepper the place again.

So I am assuming (dangerous) that the bridge system mentioned is a simple pair of radios that pass data. If you had a third, similar radio, for

example, most bridge designs have no provision to make use of the third radio. Their link design is just a very simply one.

So there are a lot of assumptions I made, but the key difference in a mesh is that it is expected that there will be multiple nodes and hundreds of them can be in one area and all will auto link. With a basic bridge, you simply replace a long wire with two radios and there is no straightforward way to add more radios.

There are, of course, many hybrid designs, that mix and match characteristics of different types of links. We would need to carefully examine the manual for the radios, but I would expect no straightforward way to make bridge devices mesh. A mesh is a much more complex design.

There are plenty of uses for bridge links. There are thousands of them in use as I send this, but a bridge is generally a distinctly different software architecture than a mesh.

Hope this unresearched speculation is of some value.

I know what HSMM-MESH does, I do not know what this particular bridge hardware/ software combo does. I suspect if they could mesh, they would advertize it.

They are running OLSRD as their MESH software

Developer is Greece firm, mfg in Utah. I would bet that someone who knows could look at their documentation and change log and see if it is WDT or some flavor based If it is, it has to be under the GPL. They did not disclose processor anywhere I could see.

Have a nice feature that they have a LED on the modem that lights when a signal is received. Helps with aiming the dish. You don't need a computer at antenna site to see signal strength. Maybe the Linksys has the same thing. Still waiting for my 2 WRT54GLs to arrive. What software/firmware version should I use?

The E-Zy package has meshing capabilities and it is using the OLSR code:

Mesh Networking is a construction of many access point implementing ad hoc type linking to form a path to destination. The path is re-formed automatically when there is prohibited route or malfunctioning device in the path, resulting a reliable wireless network service to destinations.

OLSRD - The EZ-OS deploys the efficient OLSR (Optimized Link State Routing Protocol) for mesh networking implementation. It is a pro-active, table driven and utilizes multipoint relaying for message flooding.

http://dokuwiki.e-zy.net/doku.php?id=products:ez-os:manual#mesh_networking

As for the system hardware:

Processor - Realtexk 8186
Speed - 200MHz MIPS
Flash - 2MB
SDRAM - 16MB
Radio RTL8225
Power Amplifier - SE2527

DEEP IN THEIR LITERATURE IS A STATEMENT THAT THEY USE OLSRD
WHICH IS THE SAME AS WE USE.

FROM WHAT I HAVE READ OF OUR TECHNOLOGY, I DO NOT THINK
THAT THIS IS THE CASE. ONE ANTENNA IS ALL THAT IS NEEDED.

Not sure how it would work as distance is dependent upon antenna
> power, design and altitude. Omni-directional antennas decrease effective

THEY ARE USING A FAIRLY
COMMON DESIGN OF A PANEL ANTENNA AT 9DBi.
>
> In our environment, as I see it, we would attach our antennas to a tall

TRUE
We're providing

> limited PTP backbone service as I see it. Mesh is nice, we should plan our
> system on using it, but we also have to recognize that each mesh node
> requires another operator and system.
NOT SO, SYSTEM HAS REMOTE MANAGEMENT CAPABILITIES.
ONE NODE CAN MANAGE ALL THE NODES IN A NETWORK. NOW,
WE NEED A HAM OPERATOR AT EACH SERVED AGENCY LOCATION TO KEEP
THE AGENCY HAM "HONEST" AND TO PROVIDE SUPPORT FOR DELIVERING SERVICES SUCH AS SETTING UP
VIDEO CONFERENCES, LOGGING SYSTEM, ETC, BUT WE CAN USE
UNMANNED RELAY NODES.

Additionally, we are insinuating that we will probably co-locate with a ham station.

I AM NOT ASSUMING THAT IN MY NETWORK PLAN. NODES WILL BE WHERE
WE NEED THEM IF THEY ARE RELAY NODES, AND SERVED AGENCY LOCATIONS
WILL HAVE MANNED NODES WHERE THEY WANT THEM. IN ADDITION, I AM
ONLY PLANNING ON 4 COMPUTERS AT EACH NODE. ONE FOR THE CONTROL
HAM OPERATOR. ONE IN THE EOC. TWO MORE WHERE THEY WANT THEM
WITHIN EASY TEMPORATORY CAT 5 RUNS OR AT LEAST PREINSTALLED CAT 5
RUNS UNDER 300 FT FROM THE REMOTELY LOCATED ROUTER/ANTENNA
ON THE ROOF. I AM PLANNING TO BLANKET THE ST. LOUIS METROPOLITAN
AREA SOMEDAY WITH A OVERLAY OF HSMM-MESH SERVICE THAT WITH PLANNING
ANY AGENCY CAN PREARRANGE SERVICE FROM THE HAM COMMUNITY IN CASE
THEY MAY NEED IT.

. I run a station not all that > untypical that has beaconing, SSTV, Ecomm, RMS, and
Paclink, weather and
> repeater; a lot for sure but we can expect a similarly featured ham station
> close to us to route long-distance communications.

> in general, an inside-the-disaster zone communications system; an
> outside-to-inside zone system, or an inside to outside (traffic control)
> zone system? Or all the above?
ALL OF THE ABOVE SOME DAY, BUT WE WILL START WITH THE METRO AREA
AND BUILD OUT TO SERVICE ANYONE THAT NEEDS IT.

GLENN, I WILL NEED WINLINK OR PACKET TRANSLATION AS A PLUG IN OUT ONE
OF THE LAN PORTS. I WILL PUT IT WHERE OUR MISSOURI RELAY LINK CAN GET HOLD OF THE SIGNAL .. I
HOPE THAT IS WHAT THE SERVER CARD IS FOR. TURN IT INTO PACKET AND
GIVE ME OUTPUT FOR INPUT INTO A RADIO DATA PORT.

Who will regulate our data stream and > client/consumer use if we are accessible to outside
internet users?
THERE WILL BE NO INTERNET USERS OUTSIDE OF OUR MESH NETWORK. REMEMBER, IF THE
SERVED AGENCY HAS INTERNET, THEY DO NOT NEED THIS SYSTEM.
What is our interface with Ecomm?

AS YOU STATED, WE ARE THEIR BACKBONE AND THEIR INPUT TO THE MESH. I DO NOT
THINK WE CAN LET THEM HOOK ALL THEIR NETWORKED COMPUTERS INTO OUR SYSTEM
IT WOULD DIE FROM OVERLOAD. WITH ONLY 3 TERMINALS AVAILABLE AT EACH SERVED
LOCATION, THEY WILL NOT OVERLOAD THE SYSTEM. I HOPE

GLENN: IN MY HOSPITALS, I AM PLANNING MANAGEMENT/EOC IS ONE, PHARMACY IS TWO,
AND MEDICAL IS THREE, AND CONTROL OPERATOR IS FOUR. WHAT THINKS YOU?

Are we the short-distance link between, say, the
> firefighters on the line (?)
NO USE VOICE.
and the Fire or Police Station and ham radio HF
> the long-distance link? YES IF YOU ARE ASKING INTO THE PACKET NETWORK OR TO SECURE
LIMITED INTERNET, MAYBE, HAVE NOT THOUGHT THAT FAR.

OUR SYSTEM IN ST. LOUIS WILL BE A MANAGEMENT SYSTEM, CONNECTING THE POWERS TO BE. VOICE FOR
OPERATIONS/COMMAND AND CONTROL. WE DO NOT HAVE THE DIGITAL RESOURCES TO DO INDIVIDUAL OR
CAR TO CAR COMMUNICATIONS. WE WOULD DIE.

>
> If we're having trouble getting point-to-point we'll maybe have a more
> difficult time getting mesh operators.

NOT WITH MY ONLY AT SERVED AGENCY LOCATIONS, BUILD TWO SYSTEMS ($500.00) YOU GET
TO BE LOCATED WITH ONE OF THEM AT A SERVED AGENCY LOCATION AND THE OTHER ONE
GOES TO RELAY DUTY. TWO SO YOU CAN TEST THEM OUT AND THEN WE WILL CERTIFY THEM FOR
SERVICE.
>
> I think a pursuit of PTP and planning for mesh as an option but not primary
> system is our best approach. Maybe. When, or if, the balloon goes up a mesh
> will be required someplace, so.. As long as it ain't super-EMF. PACKET CAN NOT HANDLE
THE THROUGHPUT REQUIRED. IT IS A FACTOR OF TWO SLOWER AND ALL THE BS TRYING
TO GET ACCURATE DATA THROUGH THEIR SYSTEM IS NOT WORTH SPENDING $250 FOR
NODE. WINLINK AND PACKET ARE NOW FOR MARTINE USE ONLY I KNOW YOUR
NEXT QUESTION, WHERE ARE WE GOING TO GET ALL THE MONEY WE NEED? FEMA GRANT FOR THE CITY.
I HAVE A PLAN

>
> What's the Mission Statement and Purpose Statement and then we can built

There are ports in progress of linux and/or openWRT to the RTL8186 based systems.

However, the real problem here is the size of the flash ... 2MB. The same sized flash in the wrt54g v5 was initially the reason that openWRT was not supported on that version of the router. (That limitation has been overcome for the micro version of dd-wrt: http://www.bitsum.com/openwiking/owbase/ow.asp?WRT54G5%5FCFE.)

I believe you mentioned a (Ubiquiti) 'bullet' in one of your posts. If you are keen on using a system that is integrated into an antenna, pick one that is already supported by openWRT, such as the Ubiquiti Nanostation (http://www.ubnt.com/products/nano.php , http://wiki.openwrt.org/oldwiki/openwrtdocs/hardware/ubiquiti/nanostation2) , some models of which have an external antenna connector. (Fans of olsr favour omnidirectional antennas rather than directional ones. In Austin, omni's have been used with wrt54g* routers to establish links of 7 miles.)

(But, just because the openWRT website says a board is supported, that doesn't mean that that is true. I have two 'supported' wifi devices, neither of which have I been able to install openWRT on.)

Again, HSMM-Mesh is only supported on certain versions of the wrt54g* routers. In particular, it is only supported on wrt54g* routers that have a flash size of at least 4MB. If you pick hardware other than wrt54g*, you are on your own.

This is definitely not a mesh and I see no easy way to make it one.

WRT54G routers in Rootennas could do a similar job and be much more flexible.

HSMM-Mesh is currently only supported on particular versions of the

wrt54g*

routers. So, you'd be blazing a new trail with the ez-bridge.

HSMM-Mesh has value-added- software added to openWRT. So, if openWRT can run

on ez-bridge, then you *might* be able to port HSMM-Mesh to ez- bridge.

However, I don't see ez-bridge listed in the supported section of the

openWRT website; it also isn't listed in the unsupported hardware for

openWRT either.

I think it'd be safer (though perhaps not simpler) to get a wrt54g* router,

and a rootenna... make a few mods to the router (power over ethernet) and

then you're good to go. Fab-corp even sells a 15dBi antenna. ;)

Then once you're familiar with the software, you can try branching out with

other hardware. Porting software to new hardware can be a headache, however.

Will it also include the Router Name? I am getting really tired of just
IP addresses.

From: ALERTradio ERC | N0PCO
Topic: 1575 Message: 1599

Yes, the UBNT (Ubiquiti Networks) NanoStation would be good for meshing, the UBNT Bullet would be good for Long Haul Links.

For commercial off the shelf hardware that can be quickly be deployed the UBNT Bullet has some characteristics that make ideal for rapid deployment.

I tend to look for hardware that can be used for long haul links between fixed sites. Having the MESH option for more localized and "bread crumb" for extended coverage is great to have.

If one is creating a long haul link between two sites, how will a MESH network help in this case (when there's only two points)?

In a point-to-point link having a omni antenna would send energy where it wasn't needed.. Yet in a MESH network as you mentioned a good omni antenna definitely is a plus.

Mesh - a delicious desert topping or a durable floor wax? It's both!
This is from an old SNL
skit.

No system is perfectly optimized for all uses. There are hundreds of papers published on the Internet you can pick up with a Google search that explain what a mesh is.

A Google search of "wikipedia mesh network" might be a good place to start.

If you do not have enough nodes to provide an alternate path and a node is lost, the connection is lost.

You have choices - you can either have more nodes - redundancy has been used forever in aerospace, and military applications and still works. Or you can take the time to replace the dead node and restore the link.

The overhead of running the mesh code is rather low and IF you do have another link - portable or temporary, you can get the link going again quickly. If you have a working mesh node, and take it up the tower, you can turn it on while you fix the broken existing one.

One key element of a mesh system is redundancy. If you have a sparse enough network that you cannot support mesh functions, then the mesh does you no good. Enough broken equipment is useless no mater what code it might have. Few aircraft fly when the wings fall off or when all the engines fail.

The HSMM-MESH nodes work find for point to point links - have more than one set of links if the link is that important and use directional antennas for the point to point links.

When you have multiple nodes that can see each other, then the omni antennas are best in that it will provide multiple paths for data, if the mesh is dense enough.

So point to point, use directional antennas. If the link is broken due to a power outage or whateever, the OLSR will auto link again as soon as the power is reapplied. That is not true of all systems. Some links require you to manually do something to re-establsh the link. OLSR is free and helps with a number of mobile and portable issues so lots of people are starting to use it.

You need to understand the limitations of OLSR which are explained at www.olsr.org. HSMM-MESH uses OLSR plus a numbe of other features incuding a particular addressing scheme that are not formally part of OLSR. So just because some piece of equipment uses an OLSR software module, you need to know what is built up around that as a "system" to be sure the systems will link.

HSMM-MESH is a SYSTEM that includes the use of OLSR as a module, but that is not the whole system.

TCP/IP is widely used. But you have to understand the system built around it to know if your TCP/IP system can link to another system. A knowledge of some of the modules is not sufficient to guarentee interoperability - by a long shot.

Given time, many of the hardware platforms that can support OLSR and other needed software modules might work together. But it could take years of spare time development work to make it happen. Some systems might just link and pass data.

Thanks to all those digging up the specifics to sort out what will work. Lots of hardware out there can work. We just have not had time to test is all and the toy budget is limited as well.

Share what you find out. There is a lot of slick hardware out there.

-Glenn

As hams set up networks of mesh nodes, they will have what are refered to a "pocket networks". This is, pockets of isolated networks. The challenge then is to see how you can connect the pocket networks, either permanantly with a new set of links, or temporarly in an emergency, using portable equipment that goes away after an incident.

Yes, the UBNT (Ubiquiti Networks) NanoStation would be good for meshing,

the UBNT Bullet would be good for Long Haul Links.

For commercial off the shelf hardware that can be quickly be deployed

the UBNT Bullet has some characteristics that make ideal for rapid

deployment.

I tend to look for hardware that can be used for long haul links between

fixed sites. Having the MESH option for more localized and "bread

crumb" for extended coverage is great to have.

If one is creating a long haul link between two sites, how will a MESH

network help in this case (when there's only two points)?

In a point-to-point link having a omni antenna would send energy where

it wasn't needed.. Yet in a MESH network as you mentioned a good omni

antenna definitely is a plus.

From: Robert Ellis
Topic: 1601 Message: 1601

From the latest Plano city council meeting:

Approval of Change Order
To Motorola, Inc., increasing the contract by $151,113 for providing labor and materials for transferring DragonWave links from two water towers to communication towers through an existing contract/agreement with Houston Galveston Area Council (HGAC), and authorizing the City Manager to execute all necessary documents. (HGAC Contract No. RA01-06) (Consent Agenda “I”)

Hmm. DragonWave?
http://www.dragonwaveinc.com/docs/products/DragonWave-Brochure-Sept-2009.pdf
up to 4Gbps! Now, that's what I call ultra hsmm. ;) Alas, it only costs $12k per link (which really isn't bad considering that some high end HF radios cost nearly as much.)

Maybe when 6G is rolled out, some of these old transceivers will be available on ebay. ;)

I wonder what these DragonWave links are being used for...

Plano uses a Moto-Mesh network for public safety and municipal data linking. It is a MANET network providing automatic configuration, self healing, networking for data communication primarily in mobile vehicles like police, fire, code and utility metering. This is probably an upgrade to the network "trunk" nodes. Though MANET networks are self forming and blur/eliminate the router/client dichotomy there are usually certain high performance nodes in the system that act as "backbone" to reduce the hop count on packets traversing the entire city. We had a similar system in Garland with 2Mbps nodes and some 6Mbps super nodes. That equipment is being taken down because some geniuses on the City Council defunded the maintenance of the network and then were shocked, stunned, and amazed that the network didn't perform to specification. These same geniuses concluded that mesh networks don't work and using them is a fools errand. That is the price of electing people who are technically illiterate.

What?? An infrastructure has to be maintained to keep performing as intended?? :)

From what I can tell by looking at what is installed and what I have read about the network, they are using Moto Canopy for the "trunk" (gateway) nodes. These Canopy devices are most likely (from what I have see in other networks like this) running on 5.8 GHz and they are aggregating back to tower sites around the city. The tower sites are then interconnected with the Dragonwaves.

One downside to an all-Moto solution is that the Canopy devices have very low throughput (2.5 Mbps to 3 Mbps max) and pretty high latency. Even if they can get 6 Mbps to 12 Mbps from the client to the node, the packet has to take up to 4 or 5 hops to a gateway node and then over the Canopy before it even gets to the Dragonwave.

Lots of people using mesh for lots of useful things.

The HSMM-MESH stuff we have been working on is just a shot at an inexpensive ham version of a mesh. We will continue improving it as resources allow. There are some nice commercial and military systems in use, but ALL require maintenance.

Maintenance and spare parts has always been part of keeping equipment working.

Helicopters and jet fighter planes are real impressive but some folks have no idea how much maintenance they take - it is staggering!

I guess we can take from this that if you are thinking of setting up some sort of ham mesh, and you intend it to be functional for quite a while (not just a quick demo system) you really need to have some maintenance plan in place.

We have already started looking at how to do quick swaps of broken mesh nodes on tower mounted boxes. We are trying to get it where you take out about 3 screws once you have the enclosure open, then swap the entire electronic guts of the node, slap in a new module,
and take the old one down the tower, analysis back in the radio shack with coffee, donuts, tools and good lighting, climate control test gear etc.

Sorry to hear about overlooking the "maintenance" part of the budget and mesh networking getting a bad name for it. All this type stuff is engineered to certain specs and get outside those specks and it will break.

Also, a super important lesson here is if you are putting in a ham based ECOM mesh be real aware of key folks in served agencies not understanding about maintenance. This is a very common class of real world "non technical" problem, that can cause problems keeping your mesh on the air.

Lots of nice radio sites (building roofs etc.) many times have limited access so the maintenance issue is real important to consider. Access to these type sites has always been limited for basic safety reason but since 9/11 new security regulatioons is making some sites really hard to get to when you need to make any sort of change to your gear at the host site.

Seems like a bit of a silly story, but I have come across it many times.
Keep this stuff in mind. It is not silly when you get caught by this sort of thing. It is real frustrating.

I am real intersted in learning how the Motorola Canopy and competitive
systems work out in the field.

There are easy to find sales docuemnts on the Internet, but sold field
experince is valuable and hard to come buy.

Perhaps this is a large enough topic to add to the new website we
hope to have up sometime for HSMM-MESH. The more I work with this stuff
the more I realize I don't know.

The RF landscape is changing All the time and I have trouble keeping up with it,
but for setting up our own mesh networks, the more we know about what everyone
else is doing the better off we are and can do a better job.

At some point this commercial gear will become surplus and the classic trick
for hams is to know what stuff you can get and easily modify, and what stuff
would take more effort than it was worth to try.

So I am real interested in the filed experience with the Motorola WiMAX systems.

So many projects, so little time.

Hi Glenn-

You are so correct that the field is morphing as we speak. In almost any meeting or conversation about HSMM someone comes up with yet another option, possibility or feature. It's not easy to keep up and maybe we shouldn't. I don't think we can catch this wave but we may be able to surf on it.

We need a solid plan, philosophy and concept and we can then put anything in place to meet the need. PTP or Mesh, short-haul or long-distance, inside-the-zone, or outside-the-zone, low-power, high-power, Yagi or omni.... The options go on endlessly.

Let's decide what fits what need, do a simple matrix with a cost bracket and shove off from the port.

I see EZ-Bridge as a quick-n-easy system; Bullet as a great option if one has the necessary required parts... Whether Linux based or PC based doesn't matter if what we design includes hammers with network folks.

The first step is to decide what can be done *now* with a modest amount of money, and then develop an approach to hammers that we can 'take on the road'. Most of that already exists, but we shouldn't lose sight that hammers use older equipment, slower in data speed if it does it at all, and like to keep things simple -don't we all?

So; an EZ_Bridge PTP system, a 5-port switch at both ends, PCs at both ends with one server at the base end, a GPL software suite that includes voice, data, video (OpenFire with Spark), and a philosophy of who the target audience is.

That's important because of the legal limitations that hammers have on message traffic. So; HSMM as short-haul high-intensity traffic, and HF for long-distance low-speed traffic. Mixed in with Paclink, RMS, internet, and cell phones.

I think that may be enough to start with. I'm going to write something up and put it out for comment and revision, without ownership except to start the ball rolling.

Glenn, you have it right. Now the best way to reduce turbulence is to reduce options. Let's narrow it down?

I dont think the canopy can be modified at all, from a firmware
perspective. It operates in unlicensed spectrum, but does not utilize
any standard (802.11, 802.16, etc) and is totally proprietary and will
only link with other canopy's. The base stations are gps synced so that
they will not interfere with other canopy base stations in the area. All
in all they work, but are not very spectrum efficient and is just old
technology.

The only Moto WiMAX stuff I know if is in the 2.5 GHz (licensed EBS/BRS)
spectrum. Moto-mesh uses 802.11 on the 2.4 GHz side, but not sure about
the 4.9 GHz side.
>
> So many projects, so little time.
Thats for sure!

If I had a healthy budget, I would use something like a PoE Gateworks
embedded board with Ubiquiti mini-pci radios. Just dedicating one radio

to mesh and another radio to client access helps a LOT for latency and throughput. I would couple this via CAT5 with the Ubiquiti Nanostation in areas that LoS to a tower with another Nanostation can be achieved for connecting mesh nodes to the tower.

As far as that goes, using a 3rd radio in the Gateworks board and a directional antenna, one could have PtMP, mesh and access each on their own radio and all in the same device. I have not tried this configuration yet, but seems like the software I have tried can support it.

The Ubiquiti Nanostations are cheap enough for this application and the Gateworks boards can be loaded with a variety of software, including OpenWRT/DD-WRT. As far as the Gateworks/Ubiquiti setup, all of the components are relatively inexpensive but putting them all together can add up, somewhere in the $250 to $350 range per node.

I have assembled/configured some Gateworks systems with 2 radios and loaded several different kinds of software on it (Ikarus, OpenWRT, WiLi-Mesh), and have had very good results in range and throughput. Unfortunately this was not on my budget, so I dont have any of the hardware anymore :(

I dont think the canopy can be modified at all, from a firmware

perspective. It operates in unlicensed spectrum, but does not utilize

any standard (802.11, 802.16, etc) and is totally proprietary and will

only link with other canopy's. The base stations are gps synced so that

they will not interfere with other canopy base stations in the area. All

in all they work, but are not very spectrum efficient and is just old

technology.

Sounds good to me. I can read faster than most folks can talk,
so unless the presentation contained anything more than the
sales literature, I really don't think anyone would listen to a presentation.

Motorola wants to sell expensive stuff to big clients not make stuff hams
can cheaply modify.

I did a series of guest speakers for The Robot Group in Austin for a while.
U.T. Austin supplied some fantastic profs and grad student talks. Commercial
companies sent salesmen that did not know how anything worked to
deliver a sales pitch.

Still there are some hams that work at some of the big places around town.
I could ask if they could, realistically, send out a technical speaker. We are
not big potential customers so they have no financial incentive to come tell
us how their proprietary systems work. But who knows, I will check around.

From: BILL
Topic: 1614 Message: 1614

Anyone know anything about a company in Austin named Wifi Link at 11110 Metro Blvd Suite C. Austin, Tx 78758 (512) 535-2621. He has what look like some 2.4 verticle antennas with 12 to 15 dBi for 40 to $45 when purchased in quantity.

http://www.wifi-link.com/us_wholesales.php?type=05#24ghz

I am thinking that most of the nodes I am planning will be ap nodes with a computer to handle servered Agency messages. Anyone know anything about this company or these antennas? He does not give a manufacturer.

While the price looks good, I would suggest spending a little more to get an H-polarized antenna, such as:

http://www.wlanparts.com/product/ODH24-13/13dBi_24GHz_Horiz_Pol_Omnidirectional.html

This is a slotted waveguide design for about $200. H-pol will reduce interference considerably. The grounded metal waveguide gives better lightning immunity. Any extra money spent on a good antenna will be a wise investment! They are also relatively easy to build for about $65 (especially if you are doing 10+ antennas and can get a machine shop to mill the slots).

Another link is: http://www.seattlewireless.net/SlottedWaveguide

The two links I had for some useful optimizations appear to have changed, so I need to do some searching. The first reduces the vertical lobes by slightly tweaking the size of the slots toward the ends of the waveguide. A second improves the horizontal pattern by adding "wings" to the sides of the waveguide to prevent phase cancellation of energy that wraps around the edges.

I'm getting ready for an ARES drill this weekend, so it may take a couple of days to find these tweaks. But even the standard designs work well (none of the ones we bought were optimized).

Last time I went to find this place, it ended up being a "rent a PO box" place. When I cannot find the physical location of a business, I do not buy from them. These folks may have a physical location they will disclose now, but not the last time I went looking for them.

--

The slotted waveguide antennas work well, but you need to have them in some sort of fiberglass or similar radome or insects consider the antenna a condo and such things as mud dobber wasps end up filling the whole wave guide with crud and the antenna performance degrades to near useless.

I have experimented with covering the slots with Kapton tape and that lasts for about 1 year in the weather.

So some sort of plastic or plastic like radome seems to be the best way to make these antennas work for extended periods outdoors.

They do work well, when properly constructed and the basic design is quite slick.

Seems to me that it would be easy to trianglate their signals and nail the troops to the ground since you know where they are. is they are using 802 11g, it chirps all the time. No hard to figure out where the chirps are coming from and how fast they are moving. No encryptization will keep you from just listening to the channel and triangulate their position, do not have to break the crypto.

1624. WRT54GL routing capability

Yahoo group: DAWG-HSMM
Date: 2009-10-17 05:08:51 UTC
From: John Barrett
Topic: 1624 Message: 1624

Does anyone know if the WRT54GL is capable of handling each of the ethernet ports as though it were a seperate interface ?? or do the 4 "internal" network ports appear as a single ethernet interface to the firmware ??

I'm looking at a situation where I will need to route traffic from the "public" side of the system to one of several devices that will be handing backhaul communications, with the ability to switch all traffic to a different backhaul link on demand based on the availability and tested reliability of each backhaul link, or upon receipt of an overriding command to switch to a specific link. I'm planning to have all the link testing and switching built into the GL firmware if at all possible so that once set it can operate without an external PC to control the process.

From my limited experience with the linux firewall and linux routing, it just seems like it will be easier if each backhaul device appears to be on an independent network, but if that isnt possible, it can probably be made to work by switching the ip address of the default gateway as needed to address the specific backhaul device, given that the backhaul devices can be made to co-exist on the same subnet without issues.

Comments appreciated :)

The WAN port is one network device.
The radio is one network device
The 4 port LAN switch is one network device.

It sounds like it would be a better fit if each of the 4 ports on the switch
were seperate Ethenet device for your use. Still there might be a way
to do the switching you want with the device, but it is not set up
as 5 NIC cards and a radio network.

I hope this is helpful.

From: John Barrett
Topic: 1624 Message: 1626

Thank you -- you just saved me going down an unprofitable route :)

I've got my GLs in hand and one hooked up to my home network to play with -- need to flash it with open-wrt and I can get started building a module to get what I want out of it -- use the uplink port as the interface to all the backhaul devices, and the switch ports to talk to the end users and the portal server. The module isnt going to be all that difficult to set up -- a config file with a list of backhaul devices and rules for testing the device, settings for how long a successful test series is required for the link to be considered reliable, and a priority setting just in case the module is configured to fall-up in case a higher priority link is re-established. Add on a web service interface so the portal computer can access the configuration and control the module, and it should be good to go :)

It's going to be interesting to see how it will all fit together trying to get an open-wrt mesh node, an ID-1, and a 4G wireless network to cooperate with each other :)

For those of you who have or are thinking about 4G wireless for mobile networking -- "Clear" is coming to the area starting Nov. 1. I'm going to be testing out one of their units next week and will report on its performance if anyone is interested. They have 4-8mbps downlink speeds and are offering a 2 for 1 unlimited account for $55/mo. Your choice of 2 mobile or home access nodes, or one of each. This isnt a trial discount -- no price hike ever :) I'm going to be getting 2 mobile nodes, just in case I figure out something to do with the 2nd one..... (hmmmm do we have internet at the water tower yet ??)

Actually there are VLANs, which make the 4 port LAN switch appear as 4 different lans. I have been playing with 3 ports (1 2 3) set up as 172.27.0.1 and one port (4) as 172.28.0.1. The firewall config file has the IP table rules for routing.

Look at the /etc/config directory in the router. You can edit it with vi.

The documentation is not very good, but it should get you started.
http://kamikaze.openwrt.org/docs/openwrt.html#x1-120001.2.2

the documentation for dhcp file has an error.

```
option start 100
option end 200
```

does not work to give out addresses from say 172.27.0.100 to 172.27.0.200

it should be

```
option start 100
option limit 100
```

to give out addresses from say 172.27.0.100 to 172.27.0.200

If you get it wrong it defaults to option limit 150 which was driving me crazy.

Next problem is setting up the rules to do what you want. I do not have that working yet.

Happy hunting.

From: John Barrett
Topic: 1624 Message: 1629

Will definitely have to check that out.. having separate networks makes it much easier to handle the connectivity testing since when I create the TCP socket that I'm going to use for the test, I can bind it to an address on the network of the device under test, and the OS handles the default gateway routing for that subnet automatically. Having all the devices to be tested on one subnet would have required the capability to forge the routing information for the test connection since the default route for the subnet would be pointing to the currently active backhaul device, which would not necessarily be the device under test. I believe I saw the PCAP module as part of the open-wrt module list, which would have given me the ability to forge the connection routing, but it would have taken a LOT more code to do it that way !!

At least I dont have to worry about DHCP on those subnets so the start/end/limit issues should not be a problem at all. The "public" side of the router can use the normal dhcp setup.

Setting up the firewall rules is going to be the real fun.. the control module is going to have to wipe and reload the firewall rules every time the decision is made to switch backhaul devices.

KIP !! You never sent me the information on where to get those 18db omni antennas !! Though I did find an interesting article on how to build one using coax if you'd like to save a LOT of money :) The design is simple enough to build if somewhat tedious, but you can add segments to get as much gain as you want.

1630. Re: [ntms-hsmm] WRT54GL routing capability

Yahoo group: DAWG-HSMM
Date: 2009-10-18 01:41:57 UTC
From: Glenn Currie
Topic: 1624 Message: 1630

Please check with Kip on his current work. Although the 4 port switch is one device, he has figured out a way to use some sort of virtual mapping to get at each port.

I have not examined his code, but I know he is trying to provide special services on a a particular jack on the 4 port switch. So if you can pick up on how he is able to reliably map the 4 ports in the switch, you can probably do what you originally proposed to do.

Thank you -- you just saved me going down an unprofitable route :)

I've got my GLs in hand and one hooked up to my home network to play

with -- need to flash it with open-wrt and I can get started building a

module to get what I want out of it -- use the uplink port as the

interface to all the backhaul devices, and the switch ports to talk to

the end users and the portal server. The module isnt going to be all

that difficult to set up -- a config file with a list of backhaul

devices and rules for testing the device, settings for how long a

successful test series is required for the link to be considered

reliable, and a priority setting just in case the module is configured

to fall-up in case a higher priority link is re-established. Add on a

web service interface so the portal computer can access the

configuration and control the module, and it should be good to go :)

It's going to be interesting to see how it will all fit together trying

to get an open-wrt mesh node, an ID-1, and a 4G wireless network to

cooperate with each other :)

For those of you who have or are thinking about 4G wireless for mobile

networking -- "Clear" is coming to the area starting Nov. 1. I'm going to be testing out one of their units next week and will report on its performance if anyone is interested. They have 4-8mbps downlink speeds and are offering a 2 for 1 unlimited account for $55/mo. Your choice of 2 mobile or home access nodes, or one of each. This isnt a trial discount -- no price hike ever :) I'm going to be getting 2 mobile nodes, just in case I figure out something to do with the 2nd one.....

(hmmmm do we have internet at the water tower yet ??)

From: kevin asato
Topic: 1622 Message: 1631

From a tactical standpoint, being able to triangulate on WiFi packets would not be a good idea. I would probably still aim for the largest antennas around as these are the relay sites for the mesh networks. From a command and control perspective, this has a larger impact as there are other forms of communications passing through the relay as well. (Learned about that listening to radio ops who were in Nam that you never operated your radio next to your antenna as that was where the first mortar rounds went!) The problem being that to triangulate WiFi at the origin, you have to be pretty darn close to the signal. The again triangulating bursts, you could end up aiming at a local at an internet cafe without the ability to gain intelligence from the carrier burst.

From looking at it from a Stateside perspective -

1) wearing a mesh capable device allows one to be in communications with the rest of your group. This makes it easy to know where one is at any one time without resorting to a manual roll call. All the positional information can be collected and display in a form similar to APRS. Also makes it easier to relay on-scene information (an video) to a local command post for situational awareness.

2) in the training scenario mentioned at Fort Irwin (NTC) outside of Barstow, CA, having all the troops "instrumented" makes it possible to record and evaluate friendly and enemy movements and actions for After Action Review. This has already been done on previous training programs such as MILES and AGES which had used other frequencies before. The short range of WiFi allows for intelligent spectrum management both in terms of frequency reuse and a more heirarchical communications system similar to your more intelligent (border gateway?) routing protocols. (The last part is pure speculation on my part but I have knowledge of MILES and AGES from prior job experience).

Seems to me that it would be easy to trianglate their signals and nail the troops to the ground since you know where they are. is they are using 802 11g, it chirps all the time. No hard to figure out where the chirps are coming from and how fast they are moving. No encryptization will keep you from just listening to the channel and triangulate their position, do not have to break the crypto.

I think as time passes, some phased arrays will be more available on
the market. Here's one example:
http://www.fidelity-comtech.com/PDFs/DS%20Phocus%203100x%20v2.1%20v4%20Final.pdf
These determine the direction from which a signal is coming in order
to more efficiently communicate with that signal. (So, I don't think
you need to be close to the signal in order to triangulate.)

The military seems to be moving to software defined radios. I'd bet
that they are able to change the frequencies more readily than what
you might find on a linksys router, and so could more easily avoid
attempts to triangulate positions.

1634. Mesh Config

Yahoo group: DAWG-HSMM
Date: 2009-10-19 03:20:36 UTC
From: John Barrett
Topic: 1634 Message: 1634

I've got my wrt54gl with OpenWRT sitting here, and I'm getting positively slammed for time the last few days -- can someone drop their mesh config on me so I can get up and running -- or at least a link to a current how-to -- the ones I have found so far seem to be out of date.

1635. Re: [ntms-hsmm] Mesh Config

From: Kipton Moravec
Topic: 1634 Message: 1635

The default one should work.

Just change the SSID to HSMM-MESH from APRS-MESH. The rest should be the default.

The default one what ?? there isnt much that is set right in the vanilla OpenWRT Kamikaze 8.0.9 that I have installed according to the sites I'm looking at -- are you guys running the freifunk firmware that has all that stuff as defaults (just found out about that in the last hour or so)

I'm on the repeater if you can take a minute to run me through this.

Yes, the default values work fine for me. I have a lot of nodes
and have not updated them all yet so I had to set the SSID on the
setup page to ARES-MESH the old SSID until I get all my nodes
updated. That seems to work find. I hope it solves your problem.

John, Let me see if I can help. My name is Bill Wallace, and I am the one developing a new web site for the HSMM-MESH(R) project for users like you.

First I need some information

What software did you load on your WRT54g?

Where (web page name, etc) did you get this software?

I will be sitting here waiting for your reply, so let me hear from you ASAP

Bill Wallace

Sorry John I did not see you second e-mail until I had finished answering your first one..

So you have the OLSR software installed on top of OpenWRT. Ok you are further along than I gathered from your first message.

I am going to attach a user's manual from a group in South Africa that steps people through their system quite nicely and hopefully it will help you get your system up. They use the software that the German net uses.

Take a look at it.

OK -- I've got my 2 nodes talking to each other enough to see them both in the OLSRD routing tables, and since one has a gateway to the internet, I'm getting the HNA4 alert on the other router

One thing I read in an article I found with a google search was something about using something other than the 192.168 address space for the "client" connections (I think something in the 172 range was mentioned) in order to provide static routing throughout the mesh even as the router handling a given node changes its associations with mesh peers ??

Can someone explain about that or hit me with a link that might explain a little more ??

OK -- forget I asked :) I didn't know that 172 was an unrouted address space. So I presume each mesh node gets a class C block of addresses in the 172.16-31 range ?? allowing 4096 nodes per mesh without a lot of assignment issues, and 250+ clients per node, all statically addressable from anywhere in the mesh ??

Guess I need to ask Kip for an assignment :)

1649. Re: [ntms-hsmm] Re: Mesh Config

Yahoo group: DAWG-HSMM
Date: 2009-10-20 12:05:30 UTC
From: Kipton Moravec
Topic: 1634 Message: 1649

The current system uses a random 10.xx.xx.xx based on the MAC address
for the wireless side.

The WAN port is setup to get a DHCP address, and route anything that is
not 10.xx.xx.xx if it is hooked up.

The LAN ports are to 172.27.0.1 and do NAT and the DHCP gives out 100 to
250 addresses but because it is NAT it could give out anything.

What I did was make one of the lan ports (4) 172.28.0.1 and give out
just 1 address 172.28.0.2, then passed all incoming ports not used by
the router to the PC like a dmz.

You need to join the Austin_HSMM_Development@yahoogroups.com group.
People with more details reside there.

John,

I've sent you some information on the development group that should be helpful with HSMM-MESH. We need more developers and would welcome your help.

The current system uses a random 10.xx.xx.xx based on the MAC address

for the wireless side.

The WAN port is setup to get a DHCP address, and route anything that is

not 10.xx.xx.xx if it is hooked up.

The LAN ports are to 172.27.0.1 and do NAT and the DHCP gives out 100 to

250 addresses but because it is NAT it could give out anything.

What I did was make one of the lan ports (4) 172.28.0.1 and give out

just 1 address 172.28.0.2, then passed all incoming ports not used by

the router to the PC like a dmz.

You need to join the Austin_HSMM_ Development@ yahoogroups. com group.

So if two folks have home mess systems would bring their toys together
for a meeting or whatever, they'd automatically hook up with each
other?

That sounds very cool!

Unless I am misunderstanding, having all the routers distribute the same block of 172 addresses bothers me A LOT !!! there is no easy way then to have a server connected to the mesh and directly addressable from any other location in the mesh -- its just not possible unless you can be sure that no 2 machines will ever get the same address -- there are 2 ways to accomplish that -- centralized DHCP for the entire mesh, with all nodes technically capable of providing DHCP service but only one elected server actually doing it at any time, or by assigning a different block of 172 addresses to each router.

having assigned blocks even theoretically allows you to port forward from the internet to any machine in the mesh if needed, or servers can be connected to any node of the net and appear to be statically addressed as far as any other node or client can tell.

I MUST have missed something somewhere.

Kip -- pls alleviate my ignorance -- how do you attach for instance a mail server to the mesh and let other clients access it ?? assume for the sake of example that there are no internet gateways -- a strictly private mesh, and say a pacmail server bridged to vhf or hf as the mail backbone

JOhn: I think you simple plug it into the WAN (Internet) port in the back of any node/router, and the software takes care of letting all other nodes know that it is their. There is a writeup on this somewhere on the system, But I will make you the first frequently asked question on our new Web.

The same way you do it at home.

You are given an IP address from your ISP. This is the same as the
10.xx.xx.xx RF address. What you do with the data on the otherside of
the router is up to you.

Most of the time you NAT behind the firewall so no one can get from the
outside to your PC. Typically at home I use 192.168.1.xx. I am guessing
they are using 172.27.0.xx for the addresses behind the firewall,
because it is different than 192.168.xx.xx which may be your home
network and used on the WAN port.

A home if you have a email server, then you have to open up a port on
your firewall and forward it to one of your NAT addresses. That is what
we do now.

Another option if you have a fancy router, you can have a different
Ethernet port as a DMZ. That is what I was doing by changing LAN port 4
to address 172.28.0.1 and forwarding all ports not being used by the
router to 172.28.0.2. It is now a physically different LAN.

From: BILL
Topic: 1656 Message: 1656

Here are some words I plan to use to describe the Discussion Areas on the New Web page. Does anyone have any corrections or suggestions?

Discussion Area
We use this discussion area to record suggestions, comments, and questions about the HSMM-MESH☐ technology. This area acts as an open forum on topics such as "How do I....?", "Why won't this work?", and others. The development team that developed this implementation of this technology already has a Served Client that is driving the design parameters of what it is that they need. You are welcome to modify this software to enhance it to meet the needs of your Served Agency, but this developmental team is not to add changes to this software that would be outside the scope of their mission.

Knowledge Base
We use this discussion to record common questions and answers that crop up in the course of implementing our technology. Topics include good sources of tools, information on building various parts of HSMM-MESH☐, and anything else that people in the project or interested in similar areas would find generally useful. A lot of this information is already on the web pages that we have provided.

Frequently Asked Questions
Here you will find Frequently Asked Questions and their Answers.

I still have a problem in this area as Microsoft Front Page would not support a discussion are and I had to get another bulletin board type software to perform this function. I still have to customize this new software to make it look like the actual Web Pages we have. Please excuse the disjointed look. It will be fixed.

Yes,

One of the major efforts in the version 3 firmware was to come up with
a system that would allow for a very large address space.

That was a lot of work. The earlier versions of the firmware only allowed
for 255 addresses. It was a very simple very low overhead system and was
more than enough to connect our local hospitals.

We had some interest from the Roadrunner Microwave Group and wanted
to allow for plenty of addresses.

We have a limited number of fixed, portable and mobile stations. We want to
be able to allow for many such stations and a mobile station from out of town
will eventually be able to drive through Austin and pass messages.

We hope to get store and forward sites in all major cites so, for example as
your drove up and down I-35 from Mexico to Canada and back, you could link
and pass messages at freeway speeds in every town that had store and forward
capability.

Lots of potential uses. Some of the commercial carriers will always have
better coverage than we could afford, but for emergency considerations,
the all ham infrastructure systems could be on line when other systems
are down.

Anyway at our next meeting here in Austin, we will be projecting a real time
graphic map of the mesh topology of the system at the meeting. We are
encouraging people to bring a laptop an their mesh node and we will see how
big a network we can build. It will be interesting to see the nodes come and
go as well as the links between all the nodes.

Attached is a sample map.

-Glenn

So if two folks have home mess systems would bring their toys together for a meeting or whatever, they'd automatically hook up with each other?

That sounds very cool!

OK -- Kip and I are mostly on the same page except for ONE thing -- how the users (either PC clients or application servers may be considered "users") on any particular node appear to the rest of the mesh. What follows is an untested tentative solution to providing routable IP addresses for servers attached to a mesh node. This is VERY long winded, and intended to answer comments and questions posed by both Bill and Glen. Hope you find the idea interesting :) I discussed this with Kip earlier today, and have put a lot of additional thought into what is possible since my original vague maundering over the last 2 days.

You are probably already familiar with the NAT appearance that most any router gives to the internet -- no matter how many computers are on your private LAN, they all appear to be a single IP address to the rest of the world. This is the view that Kip has taken, and as such, requires that any SERVER (mail server, web server, ftp server for instance) attached to the node be exposed to the mesh via port forwarding. This is fine until such time that you need to have 2 machines both providing the same service... say 2 web servers that you wish to have both servers appear on the default web server port 80. This is not possible with the NAT architecture.

My design target is intended to eliminate the issue by assigning each mesh user unique IP address within the mesh address space... still in the 172.16.x.x to 172.31.x.x range just as in Kip's scenario, but with each mesh node having its own subset of the address space permanently assigned. If each node is assigned a block of 256 addresses (the standard Class C subnet that you usually get on a router), the mesh address space can be broken up into 4096 blocks.

If 4096 nodes is considered insufficient (not enough nodes to go around in some cases) or a node allocation of 256 users per node is considered wasteful (your typical user with a mobile mesh node checking his mail doesn't NEED 256 addresses), there is always the Class E address space which is designated for experimental use. Class E (240.x.x.x to 255.x.x.x) has a full 28 bits of addressing available, and if we were to allocate a block of 16 address per node, that leaves 24 bits for the node address, or a potential for 16.77 million nodes in the network. It is interesting to note that in this case the node address portion of the ip address is 3 octets, just like the 10.x.x.x mesh address that is created for each node by using the last 3 octets of the router MAC address !! Since the current scenario cannot have more than 16 million nodes, there is no loss of potential nodes if this proposal/extension is implemented.

There are several drawbacks to implementing "visible" addresses on each mesh node, as follows:

1. Some sort of route updating protocol will need to be enabled to advertise what addresses are reachable via a given mesh node. I plan to experiment with BGP (Border Gateway Protocol) to handle the advertisements and forwarding of advertisements to other indirectly connected meshes. (I believe BGP broadcasts will handle updating all nodes within a continuous mesh segment, but if, for instance, 2 meshes are bridged via a tunnel/vpn over the internet to bridge a gap where there is no coverage, the advert will need to be forwarded across the tunnel.)

2. An adaptation of DNS will be required to allow access to the visible servers on any given node. This will probably end up being something along the lines of Dynamic DNS where the computer hosting the service will register it's IP address and host name with the DNS server. The adaptation required will be implementing a propagation system to distribute these DNS changes to all mesh nodes in the network (or at least to the designated name servers in each mesh segment)

3. At first, using the last 3 octets of the MAC address will be fine for computing the mesh node address and the visible ip address block, however, eventually we are going to run into a situation where 2 nodes have the same 3 octets, and there will be a conflict. One solution might be to create a registry website where you can check if your octet triple is already in use by another operator, and where you can reserve your octet triple, or be assigned a unique triple if yours is already in use. (This is also a drawback of the current system, and needs to be addressed soon, especially if you really wish to see a coast to coast mesh network with near-seamless operation)

On the plus side:

1. A node may have multiple visible (directly addressable) servers, without giving up the ability to have a large pool of users on the node isolated from the visible address space by NAT. (Blame this one on Kip.. set up a VLAN for the visible servers on one or more ethernet ports, and another VLAN with DHCP/NAT in the 172 address range for everyone else to use)

2. A node is NOT required to run the visible address system. Current NAT only nodes should have no problem interoperating with the proposed visible address system. If we use the Class E address space for the visible addresses, we dont even have to ask the current nodes to reconfigure their private network addresses to clear the 172 address space for the visible address system.

3. For nodes implementing the proposal, as they move from mesh segment to mesh segment, the BGP announcements will cause a cellular-like "follow me" effect where routing for ip addresses attached to the node will propogate across the network, making any servers on the node available for use even though the mesh node handing the servers has left one mesh segment and entered another (definition time: mesh segment: any group of mesh nodes where there is a continuous mesh path between any 2 members of the segment. For instance: To begin with, Plano and Dallas

will likely be separate segments with no purely mesh path available, but when Richardson adds nodes and fills in the gap, then Plano/Richardson/Dallas will merge into a single mesh segment). The "follow me" effect presumes that where there are gaps in coverage, that one or more nodes in each isolated segment will implement a VPN/Tunnel over the internet to link the segments.

4. If the Dynamic DNS portion of the proposal is implemented, then for all practical purposes, any server can be connected to any node, or even moved to a different node, and still provide the service as though nothing had changed.. This gives a degree of resilience in the face of mesh hardware failures. If the server is moved to a mesh node that does not implement the visible address space, but does implement a Dynamic DNS server, the server can still become visible by advertising the address of the mesh node it is connected to, and using UPnP to open the required incoming port so long as no other server on the node already has the needed port(s) in use.

There is one additional twist on the proposal/extension as presented so far. It may be desirable to move the mesh node addresses into the Class E address space, allowing for 28 bits of the MAC address to be used to calculate the mesh node address, bringing the potential node count up to 268.4 million nodes, and significantly reducing the chance of conflicts between mesh nodes. If this path were taken, then the visible address space might be moved into the 10.x.x.x range with a block size of 16 addresses per node. This would allow for 20 bits of node address, or 1 million nodes with visible server capability and would almost absolutely require that there be a registry system to prevent/resolve range assignment conflicts.

OK -- thats as far as I can go with this without more thought or some feedback on the ideas presented :)

Thanks for reading this far

Topic: 1634 Message: 1660

Lots of good ideas here. It would be good to mention that current version 4 firmware is focused to moving to IPv6 as a number of things in IPv6 have been changed with regard to addressing and support of mobile systems.

IPv6 is not perfect and will have work-arounds and patches for various systems just as IPv4 required a variety of patches to keep up with changes in real world user habits.

We just went through an extended discussion of the pros and cons of the move to IPv6 on the Austin HSMM SIG group, but we are moving HSMM-MESH to IPv6 as quickly as we can.

Which models of Linksys routers will work with ARES-MESH?

I do know that the following will work:

WRT54G ver 4 or less
WRT54GL

I have a WRT54GS ver 4. Will it work with ARES-MESH?

Thanks,

Jim, K8COP
Michigan

Topic: 1661 Message: 1662

Yes, it will work.

Please note when you pick up the binary file to load, get the version for the GS. The code that gets loaded is exactly the same but the loader expects a slightly different format. Once in memory it is exactly the same code.

The firmware will run on the models you listed plus

WRT54GS versions 1 - 4.

The speed booster models had some extra code in them
WRT54GS models 1 - 3 have double the memory of the other models
8Mb Flash 32Mb RAM These are handy for special testing and I hang onto them when I find them.

The WRT54GS version 4 has 4Mb Flash and 16Mb RAM which is what the Other models including the WRT54GL have. The pads are on the board to solder on a larger memory chip on most of the other boards. We are trying to keep our code for the Phase I HSMM-MESH nodes working within the memory space of off the shelf unmodified hardware. That keeps things simple

We have some experimental nodes with a lot more resources but we will never get the cost down below a mass produced device like the WRT54GL. And for running off a battery, the WRT54GL is the champ. It can run on anywhere from just under 4 VDC to 18VDC and pulls less current than all the other models. No moving parts Linux computer with radio running on 3 watts of power will be hard to beat.

4mb Flash 16mb RAM is enough to run the HSMM-MESH code as we call it now. Seems the ARRL has a lot of legal protection for ARES, so we changed to HSMM-MESH to trademark the name.

We intend to keep the software open and free, but if it says HSMM-MESH it will work to our particular specs. It is just to cut down on user confusion. People can change the code if they want to, but we are trying to keep it where if it says HSMM-MESH, then you know what you have and what it will work with.

I think it will work. I have not personally tried this version, but the hardware is fine. Evidently the software loader works differently on this version so you have to do a few tricks to get the new firmware in.

On the units discussed previously, you just go to the firmware update page on the web page internal to the router and tell it to update the firmware. When it asks for a filename, you just aim it at our firmware instead of a Linksys file and it takes it an loads it.

See the following instructions to get around the different loader in the TM. It is tedious, particularly if you are not a Unix or Linux user, but would expect it to work.

Once the firmware is loaded, everything should run fine.

What about the WRT54G-TM?

There are versions of DD-WRT that will work with it. But it will nor work with the HSMM-MESH software because after version 4 they reduced the memory.

I have two routers that will not work with the MESH software. I use them for routing to computers on a different channel than the MESH.

I bring the signal to the location using the MESH on Channel 1, then let people attach using my non-mesh router (DD-WRT) on channel 6 or 11.

Yes the WRT54G-TM works just fine. As mentioned the firmware out of
the box will not allow you to upload third part firmware. I have been
using
the WRT54G-TM CFE update found on the DD-WRT website. I have
then been flashing DD-WRT's fermware for a plain ol' WRT54G to the router
(the memery is big enough to load the MEGA version if you wish). After
that, you can update to just about anything you want. I have been playing
with a few WRT54G-TM's here with no problems.

From: jks19714
Topic: 1669 Message: 1669

All --

I am embarking on a project involving interfacing a Ubiquiti Networks RouterStation, XR-3 Mini-PCI modem (9 cm OFDM) and an Ionica 15-watt solid state amplifier. I hope to interface this with a slot antenna to create a useful Internet access system locally and on-board my Mobile Communications Unit (see www.armymars.net for more info).

I plan to use DD-WRT software on the RouterBoard. Does anyone on the group know if

a) this is possible?
b) it has been tried before? or
c) how to assert a voltage to the sequencer when T/R switching is required?

Many thanks. If I am successful, I will certainly document the effort on my website (and perhaps to QST or QEX, for that matter).

Topic: 1669 Message: 1670

I picked up both the XR3 (1/2-price) and the Ionica 15 watt amps off of EBay yesterday. Since Ionica was a UK company, that is where I am finding the amps. The XR3 was from a fellow here in the States.

My potential applications are primarily emcomm-related . One is a possible Internet access system atop an old Western Union microwave tower/hut in North Wilmington (near the "highest point" in Delaware, which isn't saying much). The other is a mobile communications unit I'm building (http://www.armymars .net/ArmyMARS/ MCU/index. html). In both cases, I was looking at feeding either omnidirectional slot or 180 degree sector antennas with the amplified units and then using some "barefoot" XR3's with directional antennas for the remote nodes.

John,
I too have looked at this hardware and considered such a project. What particular radios are you considering? What is your source for the amp? What is your vision for the end application; how will the system be used?
Maybe I can be of some help with some aspects of the project.

Yeah, it's too bad that the ARRL articles are typically old, like you said. Thank you for writing; I couldn't find even this stuff! Don't know if it has any value -maybe not- but if it could be tamed for use as a high-speed link backbone the door gets wider.

From what I could find online, I got the impression that low-bandwidth messaging was practical using signal processing on non-Line-of-Sight paths. I have not seen any great use of optical systems other than point-to-point laser-based LOS systems, though.

Right now, I'm concentrating on the new 9 cm wireless LAN equipment, as I believe that it will provide immediate results on a band we don't utilize very well. Use it or lose it!

From: Dave
Topic: 1668 Message: 1674

Tell me more about 9cm. That's pretty high-freq stuff too. Are you saying you're using it for a backbone, HSMM-type replacement?

Dave

Subject: [ntms-hsmm] Re: Lasers

From what I could find online, I got the impression that low-bandwidth messaging was practical using signal processing on non-Line-of-Sight paths. I have not seen any great use of optical systems other than point-to-point laser-based LOS systems, though.

Right now, I'm concentrating on the new 9 cm wireless LAN equipment, as I believe that it will provide immediate results on a band we don't utilize very well. Use it or lose it!

1675. Re: [ntms-hsmm] Ubiquiti XR-series Mini-PCI modems and External Power Amplifiers

Yahoo group: DAWG-HSMM
Date: 2009-11-05 17:36:02 UTC
From: John Spoonhower
Topic: 1669 Message: 1675

So the basic idea is to provide a hub arrangement with the tower at the center of the hub. The remotes would access the tower radio on 3.5 Ghz. Are the remotes mobile? Is the internet being made availble at the tower or elsewhere? If so, how will this be accomplished.
Sorry for all the questions...I am just trying to learn. Please correct me if my assumptions are wrong.

I picked up both the XR3 (1/2-price) and the Ionica 15 watt amps off of EBay yesterday. Since Ionica was a UK company, that is where I am finding the amps. The XR3 was from a fellow here in the States.

My potential applications are primarily emcomm-related . One is a possible Internet access system atop an old Western Union microwave tower/hut in North Wilmington (near the "highest point" in Delaware, which isn't saying much). The other is a mobile communications unit I'm building (http://www.armymars .net/ArmyMARS/ MCU/index. html). In both cases, I was looking at feeding either omnidirectional slot or 180 degree sector antennas with the amplified units and then using some "barefoot" XR3's with directional antennas for the remote nodes.

John,

I too have looked at this hardware and considered such a project. What particular radios are you considering? What is your source for the amp? What is your vision for the end application; how will the system be used?

Maybe I can be of some help with some aspects of the project.

All --

I am embarking on a project involving interfacing a Ubiquiti Networks RouterStation, XR-3 Mini-PCI modem (9 cm OFDM) and an Ionica 15-watt solid state amplifier. I hope to interface this with a slot antenna to create a useful Internet access system locally and on-board my Mobile Communications Unit (see www.armymars. net for more info).

I plan to use DD-WRT software on the RouterBoard. Does anyone on the group know if

a) this is possible?

b) it has been tried before? or

c) how to assert a voltage to the sequencer when T/R switching is required?

Many thanks. If I am successful, I will certainly document the effort on my website (and perhaps to QST or QEX, for that matter).

Yes, the tower site will (hopefully) be connected to the Internet. It will be connected via a 900-MHz Ubiquiti Networks XR9 to my station here at work (I work for PEPCO Holdings in Newark DE as a communications engineer) and possibly through a ham's WiFi connection who lives right next door to the tower. Fortunately, the XR2, XR3, and XR9 modems can be plugged into the same RouterStation board and powered over a local Ethernet cable to the hut at the bottom of the tower (with lightning protection!).

Users would be primarily fixed stations, with a few mobile or transportable stations. Antenna polarization will be horizontal, so that needs to be taken into consideration by mobile users. The tower already supports a very sophisticated Amateur TV repeater on 70 cm. with 23 and 13 cm video links to Philadelphia and Baltimore. My hope is to add an audio/video codec (MPEG-2) at the tower site (it uses an Intuitive Circuits ATV Controller, as does my mobile comm unit) and a VideoLan server at my station to provide IP Multicast-based ATV access over the 9cm network.

A lot of this is also being done within the Mobile Communications Unit which is under construction behind my office right now. Once I beat the bugs out of these systems, I hope to replicate them up at the tower site in North Wilmington as a start. We have some access to additional tower sites, but I would most likely attempt to convince the County EMA to fund them through DHS funding.

This 9cm equipment is a lot faster than 23cm D-Star if we can somehow solve the issues of relatively low power on the bare XR3 platform. I highly recommend the Radio Society of Great Britain's International Microwave Handbook as a source of information. It is much more complete and current than any of the ARRL publications that I have found. QEX has some good material occasionally, as does Funk Amateur (in German).

Ubiquiti networks:
http://www.ubnt.com/products/xr3.php

The above is for a mini pci card for use in things like the
routerstation (ubiquiti) and pcengines' alix boards.

1679. The Eagle Has Landed (adventures on 9cm)

Yahoo group: DAWG-HSMM
Date: 2009-11-11 20:16:54 UTC
From: jks19714
Topic: 1679 Message: 1679

The White Truck (Postal Service, as opposed to the famous Brown Truck) arrived with presents from far lands today. A pair of Ubiquiti XR-3 modems (presumably from China by way of California) and a pair of Ionica 9cm 15-watt amplifiers from the UK came to my workbench this morning.

One thing that I was rather surprised by -- the back of the Ionica amplifiers is covered in lead (as in Pb) foil! I suppose it is due to the fact that it is ductile and a reasonably good heat conductor, but I found myself immediately reaching for a pair of gloves. Not so much to keep my hands clean, but that Pb is not the most human-friendly element to get in your system - especially right before lunch. I guess it's the old nuke in me.

I suppose it could be worse -- at least it wasn't beryllium dust.

Anyway, just a note to anyone else considering the purchase of one of these 3400 MHz Ionica amps that they may come with a lead backing.

I have found some reasonably priced 3.4 GHz grid antennas at Streakwave Wireless (< $60 ea.) FYI. My challenge for the moment is loading the host processors in the two outdoor enclosures (Ubiquiti RouterStations) with OpenWRT. I have a few documents to read tonight before I brick, er, load these devices over the USB ports with their new firmware (although I don't know if I would have named a release of software "Kamakazi").

In the meantime, I have managed to EBay a 2-4 GHz 30dB directional coupler and an assortment of coaxial attenuators to do some testing.

Is anyone aware of a reasonably effective power meter kit suitable for this band?

I'm looking at buying an Analog Devices ADL5519 Evaluation Board for $150 to handle this task. It has TWO logarithmic detectors with 62dB of range which are rated from 1 MHz to 10 GHz, which is pretty amazing. Is anyone aware of anything simpler/easier/more cost-effective? The fact that this IC can measure such a nice range of frequencies and amplitudes (up to around -5 dBm, hence the attenuators) and both forward and reflected power simultaneously for less than an MFJ-269.... Wow.

Thanks for any insights or advice before I spend any more $$. I'm thinking of a QEX or QST article if this all (or even some) works.

:-)

Down East Microwave (http://www.downeastmicrowave.com) sells a small
microwave power meter for about $60 (as a kit) called the "ABPM". It's
good from 10KHz through 10 GHz. This device gives a "relative" power
output reading, not an exact wattage. So it's good for tuning for
greatest smoke kinda work. But check their catalog as they have a lot of
good stuff and may have something better suited to your needs.

Enjoy!

Downeast. Thanks for the reminder, I had forgotten that design from W1GHZ. I found just the thing for another part of my " Project Truck " while I was on their site a moment ago (I had been looking for a 10 MHz distribution amp yesterday and they have one already assembled for $75!).

Well, I am only going to have the amplifier on one end of the link, most likely, so I was looking for something that gave me a good forward and reverse power reading in real-time and will be a permanent part of the system.

I bought two amps, one for the Mobile Communications Unit and the other for a potential 9 cm access point at a tower in North Wilmington. It will be a "poor man's D-Star" -- but I can buy two complete sets of equipment on 9 cm for less than what I paid for my ID-1, much less the price of an Icom repeater and controller! Granted there aren't any 3.4 GHz data systems in Delaware, but there aren't any D-Star repeaters either, on any band.

Anyway, thanks for the suggestion. It solved one (unrelated) problem and is now tucked away in my brain to rattle around for a bit. It might be a really good solution for the low-power (approx 500-600 mW) remote units which I'm planning -- the W1GHZ relative power meter is good enough to know if your reverse power is less than your forward power.

As I mentioned privately before;
The PTT most likely will have to be tapped off the RF portion of
the circuit for the fastest reaction time.

Those amps look really nice, but it doesn't look like they have any
internal TX/RX switching. And that's going to be a problem at those
high frequencies and power levels.

You are correct. I have not spotted a T/R switch anywhere on the amp. There is a tiny T/R switch buried somewhere in the metal can surrounding the XR-3 RF card. I'm hoping that Ubiquiti will help identify a suitable pin on the Mini-PCI interface so that I can assert the changeover in the proper order. I'm going to need pretty good isolation to avoid smoking the receiver, for sure.

Before I go poking around on the interior, I'm going to have to get them working without the amplifiers and any changes...

OpenWRT is a remarkable little piece of code! I'm still reading the docs.

Steve:

I will answer what might be a slightly different question than what you asked. We do 100% of our development & delivery against Red Hat Enterprise Linux (currently version 5.4) & have found it to be extremely stable as an OS (we have workstations & servers in our development lab that have been running continuously throughout the more than 3 years that we have been working the current project !!). Our project consists of three parts: an embedded PC-conpatible component, a client/server socket-based controller (with no gui, just sockets to connect to), & a GUI-based user interface. All three of them include a collection of common functional code that we developed, as well as their unique portions & all are built under & targeted to run on PC hardware running linux. We have been very successful so far & continue to deliver enhancements, as well as newly developed functionality enhancements.

The reason I say that I may not be answering your direct question is that I do not currently have any experience with OpenWRT. That kind of activity is on my wish list for the day when things get a little more sane at work & I might actually have some free time to tinker a bit !! I purchased a couple of WRT54GL routers a couple of years ago, but I have not even had time to take them out of the box, let alone load up new firmware & play !!

On a related note, I have setup dual-boot lpatop & desktop systems with several varieties of Windows (Win2K, WinXP, & Win7) & RHEL5. Install your Windows first, then install the linux & the grub boot-loader automatically supports selectively booting both OS's & RHEL5 lives very amicably with Windows !!

Good luck & have fun !!

Topic: 1684 Message: 1686

I work on our HSMM-MESH code, which uses OpenWRT as a base,
using Ubuntu Linux.

One of the key differences between the different
distributions of Linux, is what directories they keep things in. If you have
been away from Linux for 8 years, you probably will not be troubled where
you "remember" key system files are kept.

That being said, any of the new distributions could be made to work.
You want to focus on a particular project, using Linux as a tool - not
recompiling the Linux kernel every day. So consider using a distribution
that lets you focus on your project, not the OS.

I find Ubuntu easy to load and maintain, and it runs all the tools I want
to use, just fine.

Ubuntu has a utility that will build you a bootable USB stick with room to
save files on a special partition on the USB stick. I use a 16GB USB stick
to run Ubuntu Linux on several of my machines that are new enough to boot
off a USB stick. It works like a champ.

I have no advice on a VM.
I would be interested in in what advice you get on a VM.
I don't need one now, but I also highly value the field
experience of other hams. You can read specs forever and
still not be sure what you are getting. Actual experience with
a tool is priceless and can save a lot of time and headaches.

Good luck with your project.

Presentation was last Monday and I generated a lot of interest. Since Boeing is a high tech military prime contractor, principally military fighter aircraft, the members of the club are all high tech engineers and they had a lot of great questions that showed they understood what I was saying and that they we interested in learning more and experimenting with the MESH technology.

Thanks for you help

When interacting with people in the Defense/Military Radio community, a term that is seen more often than MESH is MANET. HSMM networking is often MANET in its behavior.

Definition:

MANET stands for "Mobile Ad Hoc Network." A MANET is a type of ad hoc network that can change locations and configure itself on the fly. Because MANETS are mobile, they use wireless connections to connect to various networks. This can be a standard Wi-Fi connection, or another medium, such as a cellular or satellite transmission. [from http://www.techterms.com/definition/manet]

The files do not have a .sit extension, at least on the
server they don't. Your browser maintains a MIME filetype
of application/x-macbinary for files that end with .bin.
It is your browser that is changing the .bin or adding
the .sit file extension.

>Are these Mac Stuffit files that I need to "unstuff"?

These are NOT Mac Stuffit files so "unstuff" is not needed.
Either remove the MIME filetype entry from your browser or
simply rename the downloaded file to end with .bin and you'll
be ready to use said file as in the instructions.

My apologies. The problem *IS* the web server. When David's server
delivers a .bin file it tells your browser this:

Content-Type: application/x-stuffit

and thusly your browser is acting accordingly. The server probably
needs to receive an "attitude adjustment" with regards to these files. :-)

>It is your browser that is changing the .bin or adding
>the .sit file extension.

This still holds true though but because the server told your browser
the file type, application/x-stuffit.

> >Are these Mac Stuffit files that I need to "unstuff"?

This still hold true too.

>Either remove the MIME filetype entry from your browser or

You should probably ignore this line.

>simply rename the downloaded file to end with .bin and you'll
>be ready to use said file as in the instructions.

But this still holds true as well.

I'm sorry I jumped the gun. The problem does not necessarily appear to
be with your browser, per se.

I have the WRT54GL running the 0.3.1 mesh firmware and so does another local ham, so we can get familiar with HSMM-MESH.

And I have Ubuntu installed and am working through some issues with getting an OpenWRT image builder environment working.

The next step is to see if I can customize the firmware to use a Ubiquiti Bullet connected to one of the WRT54GL's LAN ports for the mesh Wi-Fi connection to extend the range.

Has anyone else looked into the feasibility of this yet?

I have a general idea of how to create another VLAN for the port the Bullet is plugged into. I haven't looked into what would need to be changed in OLSR.

I'm trying to get a few demo units running for range testing and proof of concept using the WRT54's, but would probably use something like a Mikrotik or other embedded board for the main nodes eventually.

If anyone knows of a major technical obstacle I'll encounter while pursuing this, I would appreciate your insights in advance!

OpenWrt.org website responds with a file type of
"application/octet-stream" for .bin files which is correct,
at least for these files for download into the access points.
David should tweak his server. :-)

You have some interesting pieces of hardware. I am not sure I understand what you are trying to do when you say "extend the range" - range of what? - the LAN side of the mesh connection?

You mention wanting to add OLSR to the Ubiquity Bullet device - are you trying to extend the range of the 54GL based mesh node you are plugged into? That is, extend the existing mesh network? or set up another mesh network cross linked with the mesh the 54GL is participating in?

Are your trying to use the Bullet as a mesh node or a Bi-Directional-Amp for the 54GL?

With flat land and not much RF in the path, the WRT54GL based mesh nodes with a 11dB omni antenna, connected to one antenna connector, 5 feet off the ground - no amp, can link at a distance of over 7 miles.

With gain directional antennas, and no amp we have made links of over 15 miles across down town Austin. At that point the curvature of the earth gets to be a problem on flat land, and the time of flight of the signal becomes longer than the expected ACK time for a packet on some equipment.

I am interested in your testing, but am not clear of what you are trying to do by attaching the Ubuiquiti Billet to the LAN side of a 54GL based mesh node. There are a number of different things you could do.

Thanks John. I had looked at OpenMesh, but didn't find their open source files on the first pass.

The RouterStation looks like a good way to go. I look forward to hearing more as you get it running.

I sure wish I had stopped by some weekend to see your MCU project while I was living in PA. But I enjoy the web updates.

Glen,

I would like to use the Bullet 2HP or 5HP in place of the WRT54's on-board radio to connect to the mesh network. It would plug into one of the LAN ports (it's not a bi-amp, but a 29dBm/800mw 1-port AP for $80).

The 18dBm/60mw output of the WRT54's radio isn't enough for the project I'm working on. I have a fair amount of experience with an HSMM bridged network in PA that used 400mw Senao cards and 14 dBi omni and 19dBi dish antennas and would like to stay in that range, even if it costs a little more. Ten miles across typical terrain and foliage was fairly reliable (if you could get LOS) at 5 Mbps rates. Much further and the link would downgrade to 1 Mbps or drop usually.

I need enough S/N margin to withstand heavy rain and wet foliage (we have a lot of trees here). We have access to a 1000' platform on a tower for one node, but the rest will be on 3-10 story commercial buildings in a two county area.

Radio Mobile coverage maps show that 600mw transmit power should work -- 60mw won't cover the longer links with enough margin to keep the speed up and there aren't good locations to put intermediate nodes to shorten the path.

Steve,

Sounds good. I have some of the Ubuiquiti radios and have not had time to test them.

Please post any of your findings, limited time and money keep me from testing all the stuff I would like. Also, any field experience you have with the propogation on the different bands, corrolated with the weather (rain for example) would be interesting.

There are tools that caluculate the theoritical propogation. I would be interested to know chow closely the tools match field experience.

Much of the Wi-Fi related info posted to the Internet covers experience in quickly setting up a connection, but there is not much news of how the gear works under differing conditions and for extended periods of time.

We have stayed with the WRT54GL during initial firmware development in that it took all our resources to get some of the key features we wanted in. We hope to cross port the firmware to other platforms as resources allow.

Discount electronics here in Austin sells a 1 watt 2.4GHz BDA. One of our HSMM SIG members runs a FCC RF compliance lab and tested the device.
It works fine and runs cool at 1 watt. Unfortunately it runs on 6 VDC. Not too andy for portable use.

It sells for $69.00. I have a couple of them and they seem to work as expected.

Keep us posted as to how the Bullet works. I almost ordered one, but have too much untested gear on the bench already.

1704. Bridging LAN and Wi-Fi

Yahoo group: DAWG-HSMM
Date: 2009-11-24 03:23:25 UTC
From: Steve W3AHL
Topic: 1704 Message: 1704

To simplify testing I would like to allow computers on one router's LAN access to computers on another router's LAN across the Wi-Fi mesh connection.

Having led a sheltered life with network engineers taking care of all these details, my initial attempts haven't gone well. I'm off to the library tomorrow to stock up on Linux networking references!

I've looked at info on the OpenWRT Wiki and Forum, but always manage to lock myself out of the LAN port totally and have to reflash.

I'm not concerned about security at this point. Each router would have its LAN in a unique subnet in 172.27.x.0/24.

Surely someone has done this already....

1709. HSMM Seminar - February 6, 2010

Yahoo group: DAWG-HSMM
Date: 2010-01-04 03:28:38 UTC
From: Kipton Moravec
Topic: 1709 Message: 1709

I will be holding a HSMM Seminar on February 6, 2010 at the Lucas Fire Station Training Room from 8:00 a.m. to 5:00 p.m. The Annex is the building north of the Fire Station, 165 Country Club Road, Lucas, TX 75002

This seminar will cover changing the software in WRT54GL routers to make them work in a MESH, and the other hardware and configuration necessary.

The seminar will be in 3 parts. The first part will be an overview of HSMM. The second part will be about loading the software into the router. The third part will be about special configuration of the router.

We hope to have a MESH node on the K5PRK Repeater site operational (weather permitting) before the seminar, and we will be able to see if we can hit it from the Lucas Fire Station.

The Training room is much larger than the venue for the last training, but I will have to limit the number of people to 30 because you are encouraged to bring your computer and router so you can leave with a working mesh node. Anyone with a valid Amateur Radio License is welcome to attend.

If you would like to attend please email Kipton Moravec (AE5IB)
kip@...
with your Name, Call Sign, and if you plan to bring a computer and router for the programming and configuration part of the seminar.

See you on Saturday February, 6.

Kip

Topic: 1712 Message: 1712

I was directed to this group by a member of the Net44 TCP/IP email list. He said you all were working on or had a mesh wet54 system up and running. Is there a link to more info on this and a description of your current system.

I was involved in early packet and contributed to the early JNOS project. As most early packeteers I have been away from it for awhile due to inactivity but looking to build a high-speed network in the Philadelphia area.

We have an active HSMM SIG in Austin that includes hams in the NTMS
and Roadrunner Microwave Group.

We are working to provide a general web page and hope to have it up soon.
We are doing all we can to support people interested in our work. For now,
I will send you some information off line. It is the best I can do at the moment.

As soon as we get the web page on line, I will make a general announcement.

We are having a class in Lucas, (12 miles from Plano, north of Dallas) on February 6 all day. It will hopefully tell you all you need to know - from theory to practice.

I will cover what the mesh is, what hardware, what software, configuration, etc.
You are encouraged to bring your WRT54GL (or WRT54G Version <= 4) to program it in the class. Bring a computer to load the SW. If you have a Linux computer the last session will show you how to compile the source code, so bring the Linux computer if you want to do that also.

If you can make it let me know. I have to limit the class to 30 and have 22 signed up so far.

If the weather turns good, I would like to get our first mesh node 180 Feet above ground level, at the PARK repeater site before the class. We may or may not be able to hit it from Lucas. There is a ridge in between.

Hi Kip,

I'm on the list for the class and have my WRT54GL and dual boot laptop in hand.

I was wondering if it will be any impediment to the what you have planned at the class if the router already has dd-wrt installed ?

Also, is there a relatively easy way to make a snapshot of the configuration as we'll set up in the class so it can be quickly restored later ? I anticipate using my router for other experimentation from time to time and would like to have the capability to store various configurations.

Thanks and 73s

Hi Glenn,

Yes, got it. I will print it out and study it this weekend. Is the link to firmware in the PDF? I did not see a separate reference to it.

I do have a few questions. If these are answered in the PDF then you can just reference that....

- The WRT54 had many versions. Is there only one applicable to this firmmware?

- Has the firmware/SW been ported to any other hardware? Namely the NSLU2 or equivalents. There are also specific mast mounted router/transceivers that are being used extensively in Europe and Africa that are very reasonably priced and already waterproof, POE, etc. Netgate comes to mind,

- Has there been crystal changes in your group in the WRT54 to make the channels all fall in the ham band?

- Is anyone running higher power with amps etc.?

- How are you handling connection to the Internet? Issues of content legality would seem to be an issue. Maybe you are not Internet connecting?

These are a few things that came to mind. I am sur eI will have a ton more questions. Maybe you can start a FAQ!

Kip,

I am in Philadelphia and I doubt I will be able to make a class in TX. I am a technical person and really do not need a class but rather written instructions and code. Is this going to be available?

We are having a class in Lucas, (12 miles from Plano, north of Dallas)

on February 6 all day. It will hopefully tell you all you need to know -

from theory to practice.

I will cover what the mesh is, what hardware, what software, configuration, etc.

You are encouraged to bring your WRT54GL (or WRT54G Version <= 4) to program it in the class. Bring a computer to load the SW. If you have a Linux computer the last session will show you how to compile the source code, so bring the Linux computer if you want to do that also.

If you can make it let me know. I have to limit the class to 30 and have 22 signed up so far.

If the weather turns good, I would like to get our first mesh node 180 Feet above ground level, at the PARK repeater site before the class. We may or may not be able to hit it from Lucas. There is a ridge in between.

Glenn,

Another question. If one were buying new 54's is there any advantage in this application to purchase the GS or is the GL adequate?

Doug

Doug,

I attempted to send you my Hamcom presentation as well as a pointer to the

HSMM-MESH firmware and documentation. Did you receive the information?

Kip,

I am in Philadelphia and I doubt I will be able to make a class in TX. I am a technical person and really do not need a class but rather written instructions and code. Is this going to be available?

We are having a class in Lucas, (12 miles from Plano, north of Dallas)

on February 6 all day. It will hopefully tell you all you need to know -

from theory to practice.

I will cover what the mesh is, what hardware, what software, configuration, etc.

You are encouraged to bring your WRT54GL (or WRT54G Version <= 4) to program it in the class. Bring a computer to load the SW. If you have a Linux computer the last session will show you how to compile the source code, so bring the Linux computer if you want to do that also.

If you can make it let me know. I have to limit the class to 30 and have 22 signed up so far.

If the weather turns good, I would like to get our first mesh node 180 Feet above ground level, at the PARK repeater site before the class. We may or may not be able to hit it from Lucas. There is a ridge in between.

A new WRT54GS will work as it has less memory!

http://en.wikipedia.org/wiki/Linksys_WRT54G_series

You need 16 MB SRAM and 4 MB Flash. Check the version.

Buy the WRT54GL.

Roger,

I sent some HSMM-MESH information to you at
w4rfj@...

We fully intend to have this material and code on a web page
for down load soon. At the moment we are trying to get things
set up so we can better support the code, before taking on more
support work.

I hope to make an announcement soon where they information
and code will be posted.

Happy meshing,

-Glenn

1728. Re: [ntms-hsmm] New togroup, need info

Yahoo group: DAWG-HSMM
Date: 2010-01-17 09:51:57 UTC
From: Glenn Currie
Topic: 1712 Message: 1728

The answer is buy the WRT54GL. All other versions work fine, the GL is still being manufactured ,but is more forgiving on the power input. It is happy with 3.5 VDC to 18 VDC and pulls considerably less current than any of the other hardware versions.

This is all covered with graphs of power consumption of the different models, in at the URL I sent you.

I have some of all versions in my fleet and they all work fine. The version 1 WRT54G is 5 volts only and it draws a lot more power. If you are using it in a fixed location and a few extra watts of power drain is not a problem, they function fine.

There is a whole book on the WRT54G router. Check the open-wrt.org page as well as they describe the details of all the different versions.

Glenn,

Another question. If one were buying new 54's is there any advantage in this application to purchase the GS or is the GL adequate?

Doug,

Most of your questions should be answered in the documentation. The PDF file

is a copy of my Hamcom presentation last summer and provides an overview

of the project. I sent a URL to the firmware and detailed info on the firmware.

We are on our third version of custom, ham oriented firmware for the WRT54GL.

Other questions answered in context below.

Hi Glenn,

Yes, got it. I will print it out and study it this weekend. Is the link to firmware in the PDF? I did not see a separate reference to it.>There is a URL I sent that explains the firmware and provides the binaries to>load into your router.

I do have a few questions. If these are answered in the PDF then you can just reference that....

- The WRT54 had many versions. Is there only one applicable to this firmmware? > WRT54G and WRT54GS version 1 - 4 and the WRT54GL are supported.>The WRT54GL is still for sale.

- Has the firmware/SW been ported to any other hardware? Namely the NSLU2 or equivalents. There are also specific mast mounted router/transceivers that are being used extensively in Europe and Africa that are very reasonably priced and already waterproof, POE, etc. Netgate comes to mind,>Our firmware mods are built on top of Open-WRT firmware. If you go to the>open-wrt web site and open wrt runs on hardware, our firmware will run on>on that hardware. The firmware work has been such a massive undertaking, >we have not taken the time to test other hardware than the WRT54G.

- Has there been crystal changes in your group in the WRT54 to make the channels all fall in the ham band?>Yes, check the next issue of CQ-VHF magazine. We have a dual xtal mod that> lets you use a different "slide band" crystal or the factory standard, by>changing a jumper on the back of the case.>I also have a VFO with 1 HZ resolution working so we have a "dynamic>slide band" radio as well.

- Is anyone running higher power with amps etc.?>Yes, they work but are seldom needed. We regularly do 10 mile hops across

>Austin, TX just using directional antennas. Good paths are critical and power> does not overcome a bad path. The amps are good if you want to keep the

>radio on the ground and run Andrews hard line up a tower. The amp

>overcomes feed line loss. If you are interested in joining our yahoo>group, the amp testing info is on line. One of our HSMM SIG members does>FCC acceptance testing and put some amps through the paces in his>lab.

- How are you handling connection to the Internet? Issues of content legality would seem to be an issue. Maybe you are not Internet connecting?> If you plug an Internet link into the WAN port on one of our mesh nodes,>all other nodes in RF range have Internet access is 5

seconds. We are working>out the details of having multiple Internet sources. That will be handled

>in later firmware.>Connectin g to the Internet is not needed to make use of the network, but

>it is technically trivial with our firmware.>There are those that argue endlessly about legal implications. I do not>advocate doing anything illegal. Do what you feel is legal.>Most of those arguing the legal issues never get further than arguing,>and refuse to accept that unless they are empowered to enforce

>the rules and regs, their personal opinion has no legal standing.>Again, know the rules and go by them.

These are a few things that came to mind. I am sur eI will have a ton more questions. Maybe you can start a FAQ!>The FAQ is available on our yahoo site. We hope to have the information> on an open web site soon, but our web master is a volunteer and is>working as quickly as he can.>Try the firmware and see what you think. We are deploying HSMM-MESH>at the City of Austin EOC , Red Cross and area Hospitals to augment our>existing ARCHES hospital radio network.>Thanks for your interest.

Kip,

I am in Philadelphia and I doubt I will be able to make a class in TX. I am a technical person and really do not need a class but rather written instructions and code. Is this going to be available?

We are having a class in Lucas, (12 miles from Plano, north of Dallas)

on February 6 all day. It will hopefully tell you all you need to know -

from theory to practice.

I will cover what the mesh is, what hardware, what software,

configuration, etc.

You are encouraged to bring your WRT54GL (or WRT54G Version <= 4) to

program it in the class. Bring a computer to load the SW. If you have a

Linux computer the last session will show you how to compile the source

code, so bring the Linux computer if you want to do that also.

If you can make it let me know. I have to limit the class to 30 and have

22 signed up so far.

If the weather turns good, I would like to get our first mesh node 180

Feet above ground level, at the PARK repeater site before the class. We may or may not be able to hit it from Lucas. There is a ridge in between.

From: Glenn Currie
Topic: 1712 Message: 1729

Mel,

Send me a request at
kd5mfw@...

As I mentioned we are doing a number of things so as to be able to better support the growing number of users of the code. There is a LOT of material to work through to understand the details of how the system works.

Hopefully most can just load a binary file and set their call sign and not worry about how the hardware and thousands of lines of custom code work.

We plan to have the information on a web page for general down load soon.

I try to support people getting on the air.

Each version I release, outside the way I have agreed to do it with the other developers, I am personally on the hook to support and I spend a lot of time supporting the project and code already. If I play by the rules I have agreed to with the other developers, they will help me support new users.

It is common to spend 2 -10 hours with a new user, depending on their level of experience with computer networking and Linux, and if they just want to use the system or want to know all about how it works.

We have worked several years, keeping a low profile to be able to provide a complete working system. We have been focused on supporting only active developers. The idea was to make the push to get a whole working system done before taking on the support effort.

We want to get the code out there and use it, but we have to get things set up so we can do a reasonable job of supporting the effort.

I am happy for ham radio to have an absolutely cutting edge broadband microwave mesh network system.

Also I recomend reading the HSMM section of CQ-VHF magazine. HSMM SIG member K8OCL covers the developmet work we are doing.

Hang in there with us and we will get the info out as quickly as we can.

From: Mr Doug -
Topic: 1712 Message: 1732

Thanks Glenn, Then the GL it is.

I am sure this will be answered when I get the firmware installed and look at the web setup but the documents I read over from the WIKI seemed to indicate that the domain name of your organization was "burned" in the firmware. Is this a settable item?

I was also curious about the IP addresses. As you know AMPR has its own class A address space. I am a coordinator im my region. Why has there not been a push to use AMPR address space? I presume the answer might be that by definition class A has only one point of connection to the larger Internet. Just wanted to get your take on that.

Another thing that I guess could be argued forever is the real need for emergency communications. Things are changing at such a rapid pace that I fear the need is often largely not there anymore. Commercial communications is so widespread and has so many means at this point that it almost seems unnecessary to augment it. I am not sure Haiti is a good example but in days there is probably more communications on that island than there ever has been and I would surmise very little or none is ham radio. I suspect it never hurts to have another method but I also suspect it might be harder to sell than it would have been 10 years ago.

Doug

Subject: Re: [ntms-hsmm] New togroup, need info

The answer is buy the WRT54GL. All other versions work fine, the GL is still being manufactured ,but is more forgiving on the power input. It is happy with 3.5 VDC to 18 VDC and pulls considerably less current than any of the other hardware versions.

This is all covered with graphs of power consumption of the different models, in at the URL I sent you.

I have some of all versions in my fleet and they all work fine. The version 1 WRT54G is 5 volts only and it draws a lot more power. If you are using it in a fixed location and a few extra watts of power drain is not a problem, they function fine.

There is a whole book on the WRT54G router. Check the open-wrt.org page as well as they describe the details of all the different versions.

1733. Re: [ntms-hsmm] New togroup, need info

Yahoo group: DAWG-HSMM
Date: 2010-01-17 22:53:05 UTC
From: Glenn Currie
Topic: 1712 Message: 1733

Doug,

The HSMM-MESH is a cutting edge self configuring, self healing network. It is new stuff and a very, very, very large world in itself.

As configured, there is absolutely nothing that would keep your from using HSMM-MESH, unaltered, in your organization. There is also nothing whatsoever, that would keep you from linking into AMPR IP addresses.

We are currently using IP v4 with special code to take care of things IP v4 never considered or provides a solution for. We are currently working to move to IP v6.

IPv6 has some provisions for mobile links that come and go.

If you get into the details of some key aspects of allowing for mobile and mostly not connected nodes in a network you will see what the academics are working on with DARPA on Disruption Tolerant Networks, Mobile Ad Hoc Networks and similar networks like HSMM-MESH(TM)

Some of the core things of interest to us have to do with dynamic automatic linking and dynamic automatic rerouting of streams of data.

With multiple mesh nodes linked, if one node goes down, the mesh automatically routes the data through another mesh node, with absolutely no user intervention. The mesh network is NOT the Internet. Although it can be spread out, due to the distances some of the links can have, it is useful to view it as a private network in one room of your house.

So the vast majority of what the mesh network does has nothing to do with AMPR addresses. Once the data made it to a network where AMPR has a context, you can pass the data using AMPR addresses if you wish.

It is important to use addresses within the mesh that are not forward-able on the open Internet. Again, the mesh is not the Internet. It can be connected if you like, using an AMPR address, but it can run completely stand alone.

The local AMPR administrator, N5SMN is active in our work, and we had the AMPR discussion several years ago and there is nothing we are doing that would keep you from using AMPR addresses in the context where they are relevant.

Much of what we are doing with HSMM-MESH will have some support in IPv6, and we are moving to IPv6 in later firmware. Current firmware is IPv4 based. The IPv6 work has been in progress
for about a year at this time. There is nothing in IPv6 that does much to change anything with AMPR assigned addresses. If you know of changes, let me know.

There are references to OLSR and key IPv6 considerations on the wiki link I sent. I think once you dig in a bit deeper, you may find the mesh work is much more of

a very, very large new world, than a minimal implementation of existing technology.

Except for not turning on strong software encryption, HSMM-MESH is much closer to military mesh systems than existing network systems.

One way to look at it is that on the WRT54G, there are three separate networks. The 4 port switch connections are one network and tie into existing networks, using conventional computer LAN network techniques. The wired WAN connection can be used to tie into the Internet using traditional WAN techniques.

The RF network is where all the new stuff is and it differs, significantly from the way things have been done in the past. Optimum Link State Routing is used as a new link level protocol, and that is where we do our unique addressing. If you read up on OLSR, you will see why the addressing scheme on the RF network works like it does.

The programmable router function of the WRT54G defines how the three separate networks in the box are cross linked. The way the three networks operate with HSMM-MESH(TM) firmware is different than the way they work with the factory firmware.

If you check into the 802.11b specification, you will see that all nodes using an Ad Hoc connection, use the same SSID. The OLSR mesh scheme uses a modified Ad Hoc link model. HSMM-MESH is what we chose to use for our system. Again this is part of the IEEE 802.11 spec. If you change this, and you can, your system will not link to ours. That may be what you want, but you need to understand the implications.

So we had to pick a SSID, but it is related to an 802.11 spec requirement, and not an attempt to brand the system to any organization. That is why we picked HSMM-MESH as the name to have a generic name.

The name can be changed to the name of your organization. That is configurable on the set up web page provided by HSMM-MESH firmware, served up from inside the WRT54G. We can and have set up multiple mesh networks with different network names. The channel you operate on can be changed as well.

But as one
example of the extreme flexibility of the HSMM-MESH design, is that you can have two mesh networks, operating on the same channel, using different SSIDs. It works. There are collisions as you would expect but I have run two different mesh networks on the same channel and passed live video over both of them at the same time, and it works fine. You have to get out some test gear to see the collisions.

As I said, this is more of new world, than just picking some addresses and putting your call sign in as the SSID. Working on channels 1 - 6 and setting the SSID to your call sign IS HSMM. It is just a simple version. We are doing a bit of a different type of HSMM. There are countless other ways things could be done and still be considered HSMM.

The changes to the WRT54G firmware have involved some significant heavy lifting to come up with HSMM-MESH(TM) and that is why we trade mark the system. We make it available for free, but it is not just a name, it is a quite involved system,

developed over a period of about 8 years. We kept a low profile until we had a complete working system.

If you will use the system in the way we have designed, it, your systems will link. You are free to make whatever changes you like, but if it does not follow HSMM-MESH guidelines, we cannot help you or guarantee, that data can be passed, your are on your own. Make sure that is what you want to do.

For example, you can go in and make a bunch of changes to APRS, but if you do not follow the design guide lines, your changes may be unique to your system and not work with the rest of the APRS system.

So the place where AMPR probably would make sense to use, is on the WAN port. Since it uses traditional networking techniques, no changes are needed.
Set the address to an AMPR address if you like, and deal with the benefits / implications.

We are in the process of using HSMM-MESH to link the City of Austin EOC, area hospitals and other "sites of interest". Being in the Capitol city means there are quite a few "sites of interest". So ham ecomm may be on the way out in many places, HSMM-MESH will cover the Austin area.

Also, I have not mentioned mobile links. With the fast auto linking, it is possible to pass messages as we drive by a fixed HSMM-MESH site or even another mobile unit. We have passed live video and many megabytes of files as some of the key developers travel to and from the Texas Star Party. Live video between vehicles at 80mph on I-10 in west Texas is a hoot.

The HSMM-MESH developers work with other hams at the Texas Star Party to pipe in the Internet to a guest ranch near Ft. Davis in west Texas. The TSP attracts about 800 astronomers to the foot hills around the McDonald Observatory (where I used to work). The hams bring in the Internet then set up a hybrid 802.11a / 802.11g network to provide Internet access for all the astronomers for a week. It has been a great training ground for our mesh development work.

Do a google search for Texas Star Party. We run a special events station for a week from the very well equipped TSP ham shack on the Prude Guest Ranch.

To vastly expand the flexibility of the system as well as making it more complex, any of the wired network connections on the WRT54G mesh nodes could be connected to other RF network system. As flexibility and how many different ways the existing HSMM-MESH system could be configured grows, complexity approaches infinity.
A limited subset of all possible ways to configure the system are the ones useful to focus on.

Again the information on the wiki and the many links to other references, covers how the system works.

I hope this brief summary is helpful. Beyond this, it is probably good to dig into the info on the wiki.

Thanks for your interest.

We are having a class in Lucas, (12 miles from Plano, north of Dallas)

on February 6 all day. It will hopefully tell you all you need to know -

from theory to practice.

I will cover what the mesh is, what hardware, what software,

configuration, etc.

You are encouraged to bring your WRT54GL (or WRT54G Version <= 4) to

program it in the class. Bring a computer to load the SW. If you have a

Linux computer the last session will show you how to compile the source

code, so bring the Linux computer if you want to do that also.

If you can make it let me know. I have to limit the class to 30 and have

22 signed up so far.

If the weather turns good, I would like to get our first mesh node 180

Feet above ground level, at the PARK repeater site before the class. We

may or may not be able to hit it from Lucas. There is a ridge in

between.

From: Mr Doug -
Topic: 1712 Message: 1735

Thanks again Glenn and I am downloading the book you recommended as I write this.

I did not mean to imply that there was a problem with not using AMPRNET addresses. In fact in face of the way things work in Mesh and also in real life the AMPR addresses may really not be that important. I think it is turf that they are desparately hanging onto and it made more sense in the RF packet days when we were not that Internet connected. The problem with a class A network like AMPRNET is that it really only should have one connection to its superior network. I am not sure how that would work in the Mesh topology. It probably would not. If you originate at 44.x.x.x packet on the Internet it goes to a computer at UCSD.edu and then if there is routing there via a virtual connection to that particular piece of the 44 network. There is very little real RF out there anymore. At one time we had hundreds of AMPR TCP/Ip station just here in Philadelphia and none today.

How does Mesh handle multiple Internet connections within a single Mesh network? It seems that for redundancy that would be important.

How does Mesh handle the situation where you, for example, have 3 nodes, A,B,C in a triangle, all we will say 10 miles apart, good path. If you use a direction antenna at each node, it would point at just one other node. Would you need two 54's and two antennas at each site? If so how would the two connect? Via cable or residual RF?

Subject: Re: [ntms-hsmm] New togroup, need info

Doug,

The HSMM-MESH is a cutting edge self configuring, self healing network. It is new stuff and a very, very, very large world in itself.

As configured, there is absolutely nothing that would keep your from using HSMM-MESH, unaltered, in your organization. There is also nothing whatsoever, that would keep you from linking into AMPR IP addresses.

We are currently using IP v4 with special code to take care of things IP v4 never considered or provides a solution for. We are currently working to move to IP v6.

IPv6 has some provisions for mobile links that come and go.

If you get into the details of some key aspects of allowing for mobile and mostly not connected nodes in a network you will see what the academics are working on with DARPA on Disruption Tolerant Networks, Mobile Ad Hoc Networks and similar networks like HSMM-MESH(TM)

Some of the core things of interest to us have to do with dynamic automatic linking and dynamic automatic rerouting of streams of data.

With multiple mesh nodes linked, if one node goes down, the mesh automatically routes the data through another mesh node, with absolutely no user intervention. The mesh network is NOT the Internet. Although it can be spread out, due to the distances some of the links can have, it is useful to view it as a private network in one room of your house.

So the vast majority of what the mesh network does has nothing to do with AMPR addresses. Once the data made it to a network where AMPR has a context, you can pass the data using AMPR addresses if you wish.

It is important to use addresses within the mesh that are not forward-able on the open Internet. Again, the mesh is not the Internet. It can be connected if you like, using an AMPR address, but it can run completely stand alone.

The local AMPR administrator, N5SMN is active in our work, and we had the AMPR discussion several years ago and there is nothing we are doing that would keep you from using AMPR addresses in the context where they are relevant.

Much of what we are doing with HSMM-MESH will have some support in IPv6, and we are moving to IPv6 in later firmware. Current firmware is IPv4 based. The IPv6 work has been in progress
for about a year at this time. There is nothing in IPv6 that does much to change anything with AMPR assigned addresses. If you know of changes, let me know.

There are references to OLSR and key IPv6 considerations on the wiki link I sent. I think once you dig in a bit deeper, you may find the mesh work is much more of a very, very large new world, than a minimal implementation of existing technology.

Except for not turning on strong software encryption, HSMM-MESH is much closer to military mesh systems than existing network systems.

One way to look at it is that on the WRT54G, there are three separate networks. The 4 port switch connections are one network and tie into existing networks, using conventional computer LAN network techniques. The wired WAN connection can be used to tie into the Internet using traditional WAN techniques.

The RF network is where all the new stuff is and it differs, significantly from the way things have been done in the past. Optimum Link State Routing is used as a new link level protocol, and that is where we do our unique addressing. If you read up on OLSR, you will see why the addressing scheme on the RF network works like it does.

The programmable router function of the WRT54G defines how the three separate networks in the box are cross linked. The way the three networks operate with HSMM-MESH(TM) firmware is different than the way they work with the factory firmware.

If you check into the 802.11b specification, you will see that all nodes using an Ad Hoc connection, use the same SSID. The OLSR mesh scheme uses a modified Ad Hoc link model. HSMM-MESH is what we chose to use for our system. Again this is part of the IEEE 802.11 spec. If you change this, and you can, your system

will not link to ours. That may be what you want, but you need to understand the implications.

So we had to pick a SSID, but it is related to an 802.11 spec requirement, and not an attempt to brand the system to any organization. That is why we picked HSMM-MESH as the name to have a generic name.

The name can be changed to the name of your organization. That is configurable on the set up web page provided by HSMM-MESH firmware, served up from inside the WRT54G. We can and have set up multiple mesh networks with different network names. The channel you operate on can be changed as well.

But as one
example of the extreme flexibility of the HSMM-MESH design, is that you can have two mesh networks, operating on the same channel, using different SSIDs. It works. There are collisions as you would expect but I have run two different mesh networks on the same channel and passed live video over both of them at the same time, and it works fine. You have to get out some test gear to see the collisions.

As I said, this is more of new world, than just picking some addresses and putting your call sign in as the SSID. Working on channels 1 - 6 and setting the SSID to your call sign IS HSMM. It is just a simple version. We are doing a bit of a different type of HSMM. There are countless other ways things could be done and still be considered HSMM.

The changes to the WRT54G firmware have involved some significant heavy lifting to come up with HSMM-MESH(TM) and that is why we trade mark the system. We make it available for free, but it is not just a name, it is a quite involved system, developed over a period of about 8 years. We kept a low profile until we had a complete working system.

If you will use the system in the way we have designed, it, your systems will link. You are free to make whatever changes you like, but if it does not follow HSMM-MESH guidelines, we cannot help you or guarantee, that data can be passed, your are on your own. Make sure that is what you want to do.

For example, you can go in and make a bunch of changes to APRS, but if you do not follow the design guide lines, your changes may be unique to your system and not work with the rest of the APRS system.

So the place where AMPR probably would make sense to use, is on the WAN port. Since it uses traditional networking techniques, no changes are needed.
Set the address to an AMPR address if you like, and deal with the benefits / implications.

We are in the process of using HSMM-MESH to link the City of Austin EOC, area hospitals and other "sites of interest". Being in the Capitol city means there are quite a few "sites of interest". So ham ecomm may be on the way out in many places, HSMM-MESH will cover the Austin area.

Also, I have not mentioned mobile links. With the fast auto linking, it is possible to pass messages as we drive by a fixed HSMM-MESH site or even another mobile unit. We have passed live video and many megabytes of files as some of the key

developers travel to and from the Texas Star Party. Live video between vehicles at 80mph on I-10 in west Texas is a hoot.

The HSMM-MESH developers work with other hams at the Texas Star Party to pipe in the Internet to a guest ranch near Ft. Davis in west Texas. The TSP attracts about 800 astronomers to the foot hills around the McDonald Observatory (where I used to work). The hams bring in the Internet then set up a hybrid 802.11a / 802.11g network to provide Internet access for all the astronomers for a week. It has been a great training ground for our mesh development work.

Do a google search for Texas Star Party. We run a special events station for a week from the very well equipped TSP ham shack on the Prude Guest Ranch.

To vastly expand the flexibility of the system as well as making it more complex, any of the wired network connections on the WRT54G mesh nodes could be connected to other RF network system. As flexibility and how many different ways the existing HSMM-MESH system could be configured grows, complexity approaches infinity.
A limited subset of all possible ways to configure the system are the ones useful to focus on.

Again the information on the wiki and the many links to other references, covers how the system works.

I hope this brief summary is helpful. Beyond this, it is probably good to dig into the info on the wiki.

Thanks for your interest.

-Glenn

Topic: 1712 Message: 1736

Doug,

Handling multiple Internet connections into one mesh is not handled automatically in the current firmware. It is one of the many things on the list for later firmware. We made the one link trivial and more code is needed to sort out multiple links, do load sharing etc, and there is only so much room in the memory of a WRT54G for code.

We typically choose to link to the Internet via our private Internet link in the City of Austin EOC. This link has redundant connections to the Internet and is completely separate from all other Internet links in the building.

Field operators can check if there is a live link and inject one as needed. If they see more than one link they can contact operators and get them to add or remove links as needed.

Sorting out multiple Internet links, determining dynamic Quality of Service and load splitting are non trivial tasks, but are on the "want" list for future firmware.

The WRT54G normally runs with two antennas in diversity mode, it simply switches (very rapidly) between the two antennas and talks to a node on the antenna on which it received your last signal. Aim two directional antennas in two different directions, and the radio will sort it out automatically, choosing the correct antenna. No user intervention needed.

If you need more directions add more mesh nodes aim the directional antennas and cross link them with the wired connections on the back of the mesh nodes.

We are getting into discussing a mixed network. We find with 11 dB omni antennas WRT54G routers will link at over 7 miles with no amp. Make it 3 to 5 miles between nodes and you operate as a true mesh when you have a minimum of 3 nodes.

If you have less than 3 nodes in your network, you have, by definition, a point to point link. The same firmware will work fine, but you need more nodes within RF range to have an actual mesh.

Distances mentioned are with good Line Of Sight
paths with clear Fresnel zones. Amps do little good if the path is not there, unless you have enough power to burn a hole in what is in the way. If so, when the smoke clears you may have a better link. One watt bidirectional 2.4GHz amps are sold in the Austin area for $69.00 by Discount Electronics. They are on the web. If you have to run more than 0.5 to 1 watt you need to seek a better path, the power is just going to make a mess and not get your signal where you want it.

We do 10 miles, at will with no amps across hundreds of thousands of cordless phones, wireless computer networks (thousands around the U.T. campus) and microwave ovens. Just use high gain directional antennas, aim them carefully (a whole

presentation) and clamp them securely in place. These links are made a will with no amps.

If the links get too far apart, you are talking about a point to point link. You could put up multiple radios at each end and if one died the others would automatically take over. So put two like mesh nodes on each end, with independent power and antennas, and you have a redundant link with auto switch over.

For 1 to 5 mile hops we recommend vertical polarization of omni directional antennas to form a true mesh. If you set up a point to point link we recommend horizontal polarization.

Glenn

Thanks for the link.

I had a quick look through the TOC and the book and it looks excellent.....it is especially nice to see the DIY projects!

I know in my part of the world where the Internet is practically in every home, it is difficult to motivate HAMS to use Packet because of the speed challenge.....the only time the low speed RF networks are used is during emergencies and then the very low bandwidth and congestion is an issue.

This may be a good solution for both backbone and LAN.....I look forward to reading the book.

Greetings Kip,
Would love to attend your class, but I am in Ypsilanti, Michigan (next door to Ann Arbor) -- and Doug WA3DSP is in Philadelphia. Not likely either of us will get down to Plano - HI HI.

Is there any chance the training material will be available online?
And where does one find the website where the software is available?

Thanks!

Glenn

Thanks for the link.

I had a quick look through the TOC and the book and it looks excellent.....it is especially nice to see the DIY projects!

I know in my part of the world where the Internet is practically in every home, it is difficult to motivate HAMS to use Packet because of the speed challenge.....the only time the low speed RF networks are used is during emergencies and then the very low bandwidth and congestion is an issue.

This may be a good solution for both backbone and LAN.....I look forward to reading the book.

If you have any interest at all in HSMM, you need to down load this free book.

<http://wndw. net/download. html>

This book tells how to set up a mesh network in a developing country, which is about 99% the same job as setting up a HSMM network in that you have to supply all the infrastructure.

This book tells you how to set up a nice mesh network.
They cover all the key things you need to know. They discuss using the WRT54G. Just use HSMM-MESH firmware instead of the similar firmware they mention and you have a 425 page book that tell you what to do to set up a mesh network.

Again, if you have ANY intrest in HSMM, you need to take a look at this free book. It pretty much explains what we have independently developed in the Austin HSMM SIG, except we have developed a our own custom firmware and done crystal mods.

From: Glenn Currie
Topic: 1712 Message: 1742

Bob,

Glad you got a copy of the book. It is excellent. It provides an overview of about 98% of what we are doing here in Austin.

I have been prompted to write a book for ham on HSMM. I was working on it for a while until the doctors told me they think I have ALS and that is why I have no energy and have a variety of other problems.

The City of Austin Office of Emergency Management worked with us to get 2m and 440 packet in Austin area hospitals. We are approching 40 stations now. Where it makes sense in dense urban environments, we are adding broad band HSMM-MESH microwave links so we can hold up our own network between the hospitals as needed.

The military is using systems very similar to HSMM-MESH when they deploy to an "area of interest" now. So this is the new system of choice for emergencies - natural and man made.

As you go through the book you down loaded, let me know what you might think of the usefulness of a ham oriented book that covered similar topics but was written with a ham radio emphasis.

I have set aside all my many projects and focused on HSMM-MESH for the time I have left. I need to know what sorts of materials would provide the most help to put this technology "over the top" with hams.

It is used by millions of non hams and in a beefed form, by the military. Hams now have a state of the art broadband solution that works well. We have many more follow ons in the works.

I have focused on getting key software and firmware working and doing a limited amount of promotion. The largest push for promotion was at Hamcom last summer. K8OCL and I did a well attended 2 hour HSMM presentation.

John Champa, K8OCL also has documented our HSMM-MESH work in his HSMM column in CQ-VHF magazine. John has a lot of contacts and has been a big help in getting the word out.

We should have a regular web page on line soon, and I am waiting to have it in place, before putting on the next big publicity push.

Remind me if I sent you a copy of my Hamcom presentation. It covers our migration from the older packet systems to HSMM. We still have a packet every Sunday night and maintiain packet capability at all the

area hospitals. We have a couple of the original TexNet developers in our group. So we have significant packet activity in our area.

I have to carefully pick and choose where to dedicate my efforts to help promote HSMM with the time I have left. I have ideas on what is needed, but it is always good to poll interested people in what would help them the most.

Anybody on this mailing list that has suggestions on what would be of the most help to get you on the air with HSMM let me know what you think.

My fingers do not work so well any more so each posing is a significant effort and I would like to make sure I am "aimed" in the right direction.

The questions indicate interest in my pet project so they are appreciated. I do not wish to be curt with my replys but attempting to summarize some pretty complex stuff is not easy, and it takes me a while to get stuff typed in, so I do not do as much editing as I would like. I just have to send out some relative raw material or I will not get anything out at all.

--

Here is how I see HSMM-MESH and related systems growing.

We find someone in an area that has an interest and that ham gets with a few of his / her buddies and gets a few nodes up. Each of these "pocket nets" may be relatively isolated. We can link them with point to point links and also bridge to them like getting to an IRLP or Echolink repeater link. We can replace the wired Internet link with a ham RF link in some places as the adoption increases.

The pocket nets may have different roles to play in different places but share the ability to be linked.

We are using microwave. It works well with current gear in 5 to 10 mile hops. Some hams are islolated out in the country but go to QRZ.com and type in your call sign, where it offers to show you a grid map, click on it.

On the grid square map, click on "show hams" where I live there are 170 hams in my grid square, about 165 more than needed to support a mesh in my square.

Look at the grid squares in any metropolitian area in the U.S. and you will see the "Proof of theoritical HSMM-MESH viability" That is in most towns, there are enough hams to support a ham only mesh network. In some places the hams interested in HSMM may need to approach a ham that lives in a key spot and ask them to sponsor a node. This is not all that different than what hams have done for ages - find a fellow ham that has a site with a good place for a radio relay and see if they will sponsor a relay.

I fall back on the APRS system, if you only have a few people doing it, it is interesting, but these days, it is really quite a system. Like a linked repeater system, APRS just too a while to get to where it is now. HSMM could have a similar growth pattern.

There are may ways we could have gone with HSMM-MESH development, but we chose to go with one of the least expensive ways to get started and then get the firmware super charged to where it has capability that rivals military networks, and then introduce the initial, complete working system.

We have a lot more in the works, but the current HSMM-MESH will do a bang up good job for our original project of linking the hospitals. For the hospital link project, the rest is gravy. But as the capability of the system continues to grow, we have many more plans in the works.

Hospitals are located on major roads. Hams with mobile mesh nodes can act as bees passing pollen between flowers as they drive between fixed nodes. This physical store and forward technique is referred to as a "data mule". These techniques are in use in India, where buses are data mules. When they travel to a small town, all the stored emails going both ways are traded. The military likes it because it represents a profoundly robust data network that can continue to keep part of a network moving, even if it has delays, under the worst of conditions.

So the data mule system could be built on top of the hospital HSMM network. The "smart guys" that publish all the academic papers to the Internet are working on it. We just have to keep up with the litrature. That is how I was able to pick a development path for HSMM-MESH and why the system has key characteristics of military networks.

Some of the stuff is real complex. We worked on getting a lot of stuff like the auto linking of nodes working before we turned the system loose on the world. We continue to automate the tough tasks so the user pretty much just turns on the mesh node, plugs their laptop in the back of the WRT54G and they are linked or they need to move to where they can get a link. There is a minimum of messing with addressing and routing for most users to do.

Thanks for your interest and I would be happy to hear of projects you would like to do with HSMM. The potential is great, we just have to get the word out.

It is fun to be on one side of Austin, aiming a 24dB BBQ grill dish, coordinating on a 440 MHz simplex channel and saying "Ok I see your signal, let me adjust the antenna a bit. Your turn, adjust your antenn a bit and lock it down". Then turn on the IP video cameras and do some broadband (22MHz) QRP work, shooting though thousands of other signals and putting your signal exactly where you want it.

Our longest link with no amps on barefoot WRT54GL equipment is 15.56 miles. At 15 miles, you are reminded the earth is a sphere as the curvature becomes a significant consderation in your link.

There are many details, but, fortunately you really do not have to know that much to be safe, have fun, and not bother any one else.

I hope to support a few "spark plugs" in various areas and have them teach the other HSMM hams how to set up and enjoy a ham radio mesh network.

Kip is doing his HSMM session soon and has 22 hams signed up already. This is a super opportunity to learn a lot and walk out with a working HSMM station.

Perhaps we can work up such workshops at some of the ham radio conventions
and help people in other parts of the country get rolling.

All that help have my appreciation.

Subject: Re: [ntms-hsmm] New togroup, need info

Doug,

Handling multiple Internet connections into one mesh is not handled automatically in the current firmware. It is one of the many things on the list for later firmware. We made the one link trivial and more code is needed to sort out multiple links, do load sharing etc, and there is only so much room in the memory of a WRT54G for code.

We typically choose to link to the Internet via our private Internet link in the City of Austin EOC. This link has redundant connections to the Internet and is completely separate from all other Internet links in the building.

Field operators can check if there is a live link and inject one as needed. If they see more than one link they can contact operators and get them to add or remove links as needed.

Sorting out multiple Internet links, determining dynamic Quality of Service and load splitting are non trivial tasks, but are on the "want" list for future firmware.

The WRT54G normally runs with two antennas in diversity mode, it simply switches (very rapidly) between the two antennas and talks to a node on the antenna on which it received your last signal. Aim two directional antennas in two different directions, and the radio will sort it out automatically, choosing the correct antenna. No user intervention needed.

If you need more directions add more mesh nodes aim the directional antennas and cross link them with the wired connections on the back of the mesh nodes.

We are getting into discussing a mixed network. We find with 11 dB omni antennas WRT54G routers will link at over 7 miles with no amp. Make it 3 to 5 miles between nodes and you operate as a true mesh when you have a minimum of 3 nodes.

If you have less than 3 nodes in your network, you have, by definition, a point to point link. The same firmware will work fine, but you need more nodes within RF

range to have an actual mesh.

Distances mentioned are with good Line Of Sight
paths with clear Fresnel zones. Amps do little good if the path is not there, unless you have enough power to burn a hole in what is in the way. If so, when the smoke clears you may have a better link. One watt bidirectional 2.4GHz amps are sold in the Austin area for $69.00 by Discount Electronics. They are on the web. If you have to run more than 0.5 to 1 watt you need to seek a better path, the power is just going to make a mess and not get your signal where you want it.

We do 10 miles, at will with no amps across hundreds of thousands of cordless phones, wireless computer networks (thousands around the U.T. campus) and microwave ovens. Just use high gain directional antennas, aim them carefully (a whole presentation) and clamp them securely in place. These links are made a will with no amps.

If the links get too far apart, you are talking about a point to point link.
You could put up multiple radios at each end and if one died the others would automatically take over. So put two like mesh nodes on each end, with independent power and antennas, and you have a redundant link with auto switch over.

For 1 to 5 mile hops we recommend vertical polarization of omni directional antennas to form a true mesh. If you set up a point to point link we recommend horizontal polarization.

Thanks again Glenn and I am downloading the book you recommended as I write this.

I did not mean to imply that there was a problem with not using AMPRNET addresses. In fact in face of the way things work in Mesh and also in real life the AMPR addresses may really not be that important. I think it is turf that they are desparately hanging onto and it made more sense in the RF packet days when we were not that Internet connected. The problem with a class A network like AMPRNET is that it really only should have one connection to its superior network. I am not sure how that would work in the Mesh topology. It probably would not. If you originate at 44.x.x.x packet on the Internet it goes to a computer at UCSD.edu and then if there is routing there via a virtual connection to that particular piece of the 44 network. There is very little real RF out there anymore. At one time we had hundreds of AMPR TCP/Ip station just here in Philadelphia and none today.

How does Mesh handle multiple Internet connections within a single Mesh network? It seems that for redundancy that would be important.

How does Mesh handle the situation where you, for example, have 3 nodes, A,B,C in a triangle, all we will say 10 miles apart, good path. If you use a direction antenna at each node, it would point at just one other node. Would you need two 54's and two antennas at

each site? If so how would the two connect? Via cable or residual RF?

Subject: Re: [ntms-hsmm] New togroup, need info

Doug,

The HSMM-MESH is a cutting edge self configuring, self healing network. It is new stuff and a very, very, very large world in itself.

As configured, there is absolutely nothing that would keep your from using HSMM-MESH, unaltered, in your organization. There is also nothing whatsoever, that would keep you from linking into AMPR IP addresses.

We are currently using IP v4 with special code to take care of things IP v4 never considered or provides a solution for. We are currently working to move to IP v6.

IPv6 has some provisions for mobile links that come and go.

If you get into the details of some key aspects of allowing for mobile and mostly not connected nodes in a network you will see what the academics are working on with DARPA on Disruption Tolerant Networks, Mobile Ad Hoc Networks and similar networks like HSMM-MESH(TM)

Some of the core things of interest to us have to do with dynamic automatic linking and dynamic automatic rerouting of streams of data.

With multiple mesh nodes linked, if one node goes down, the mesh automatically routes the data through another mesh node, with absolutely no user intervention.

The mesh network is NOT the Internet. Although it can be spread out, due to the distances some of the links can have, it is useful to view it as a private network in one room of your house.

So the vast majority of what the mesh network does has nothing to do with AMPR addresses. Once the data made it to a network where AMPR has a context,

you can pass the data using AMPR addresses if you wish.
It is important to use addresses within the mesh that are not forward-able on the open Internet. Again, the mesh is not the Internet. It can be connected if you like, using an AMPR address, but it can run completely stand alone.
The local AMPR administrator, N5SMN is active in our work, and we had the AMPR discussion several years ago and there is nothing we are doing that would keep you from using AMPR addresses in the context where they are relevant.
Much of what we are doing with HSMM-MESH will have some support in IPv6, and we are moving to IPv6 in later firmware. Current firmware is IPv4 based.
The IPv6 work has been in progress
for about a year at this time. There is nothing in IPv6 that does much to change anything with AMPR assigned addresses. If you know of changes, let me know.
There are references to OLSR and key IPv6 considerations on the wiki link I sent.
I think once you dig in a bit deeper, you may find the mesh work is much more of a very, very large new world, than a minimal implementation of existing technology.
Except for not turning on strong software encryption, HSMM-MESH is much closer to military mesh systems than existing network systems.
One way to look at it is that on the WRT54G, there are three separate networks.
The 4 port switch connections are one network and tie into existing networks, using conventional computer LAN network techniques. The wired WAN connection can be used to tie into the Internet using traditional WAN techniques.
The RF network is where all the new stuff is and it differs, significantly from the way things have been done in the past. Optimum Link State Routing is used as a new link level protocol, and that is where we do our unique addressing. If you read up on OLSR, you will see why the addressing scheme on the RF network works like it does.
The programmable router function of the WRT54G defines how the three separate networks in the box are cross linked. The way the three networks operate with

HSMM-MESH(TM) firmware is different than the way they work with the factory firmware. If you check into the 802.11b specification, you will see that all nodes using an Ad Hoc connection, use the same SSID. The OLSR mesh scheme uses a modified Ad Hoc link model. HSMM-MESH is what we chose to use for our system. Again this is part of the IEEE 802.11 spec. If you change this, and you can, your system will not link to ours. That may be what you want, but you need to understand the implications.

So we had to pick a SSID, but it is related to an 802.11 spec requirement, and not an attempt to brand the system to any organization. That is why we picked HSMM-MESH as the name to have a generic name.

The name can be changed to the name of your organization. That is configurable on the set up web page provided by HSMM-MESH firmware, served up from inside the WRT54G. We can and have set up multiple mesh networks with different network names. The channel you operate on can be changed as well.

But as one

example of the extreme flexibility of the HSMM-MESH design, is that you can have two mesh networks, operating on the same channel, using different SSIDs. It works. There are collisions as you would expect but I have run two different mesh networks on the same channel and passed live video over both of them at the same time, and it works fine. You have to get out some test gear to see the collisions.

As I said, this is more of new world, than just picking some addresses and putting your call sign in as the SSID. Working on channels 1 - 6 and setting the SSID to your call sign IS HSMM. It is just a simple version. We are doing a bit of a different type of HSMM. There are countless other ways things could be done and still be considered HSMM.

The changes to the WRT54G firmware have involved some significant heavy lifting to come up with HSMM-MESH(TM) and that is why we trade mark the system. We make it available for free, but it is not just a name, it is a quite involved system, developed over a period of about 8 years. We kept a low profile until we had a

complete working system.

If you will use the system in the way we have designed, it, your systems will link.

You are free to make whatever changes you like, but if it does not follow

HSMM-MESH guidelines, we cannot help you or guarantee, that data can be passed,

your are on your own. Make sure that is what you want to do.

For example, you can go in and make a bunch of changes to APRS, but if you

do not follow the design guide lines, your changes may be unique to your system and

not work with the rest of the APRS system.

So the place where AMPR probably would make sense to use, is on the WAN port. Since it uses traditional networking techniques, no changes are needed.

Set the address to an AMPR address if you like, and deal with the benefits /

implications.

We are in the process of using HSMM-MESH to link the City of Austin EOC,

area hospitals and other "sites of interest". Being in the Capitol city means

there are quite a few "sites of interest". So ham ecomm may be on the way

out in many places, HSMM-MESH will cover the Austin area.

Also, I have not mentioned mobile links. With the fast auto linking, it is possible

to pass messages as we drive by a fixed HSMM-MESH site or even another mobile

unit. We have passed live video and many megabytes of files as some of the key

developers travel to and from the Texas Star Party. Live video between vehicles

at 80mph on I-10 in west Texas is a hoot.

The HSMM-MESH developers work with other hams at the Texas Star Party to pipe

in the Internet to a guest ranch near Ft. Davis in west Texas. The TSP attracts about

800 astronomers to the foot hills around the McDonald Observatory (where I used to

work). The hams bring in the Internet then set up a hybrid 802.11a / 802.11g

network to provide Internet access for all the astronomers for a week. It has been

a great training ground for our mesh development work.

Do a google search for Texas Star Party. We run a special events station for a week

from the very well equipped TSP ham shack on the Prude Guest Ranch.

To vastly expand the flexibility of the system as well as making it more complex, any

of the wired network connections on the WRT54G mesh nodes could be connected

to other RF network system. As flexibility and how many different ways the existing

HSMM-MESH system could be configured grows, complexity approaches infinity.

A limited subset of all possible ways to configure the system are the ones useful to focus on.

Again the information on the wiki and the many links to other references, covers

how the system works.

I hope this brief summary is helpful. Beyond this, it is probably good to dig into

the info on the wiki.

Thanks for your interest.

Doug,

I buy most of my antennas from www.fab-corp.com. They are hams.
Tell them you are a ham an you may get a discount.

<http://www.fab-corp.com/product.php?productid=2425&cat=250&page=1>

is a pointer to a good solid performer. We call it the "baseball bat" as it
is has a super sturdy fiberglass radome on it.

Be careful with the ~ 15dB gain antennas that fab-corp sells for 2.4 GHz.

Some are available with a 12 degree down tilt on the pattern, which
generally looks like a donut. Make sure the pattern goes where you intend.

For a compact directional AD5OO and I use a MFJ stamped metal yaggi.
It cost about $30.00, looks like crap, make that, MFJ standard construction.
You need to put it in a radome to keep the wind from blowing it around.
Despite what it looks like it is a FANTASTIC performer - works like a champ.

<http://www.mfjenterprises.com/Product.php?productid=MFJ-1800>

I have a old Electronic News Gathering van with a 40 foot pneumatic mast.
When I put the 15 dB Comet omni on it and run the mast up. There is a dead
spot right under the antenna and around the van.

The simpler "baseball bat" has abot 10 times the fiberglass in the radome and
we have found it to work well. The basic omni pattern is a donut and I do not
end up "blacking my self out" down in the radio van.

"Moby Dick" is a 1987 Ford 350 1 ton van Made back when gas was cheap.
It has a 460 cu in. V-8 with a big 4 barrel carburator. It rides like a tank and
the big engine will hural the big white box at a truly scarey speed down the road.
It also has a 6 kw water cooled Honda Generator.

I bought it off a felow ham microwaver, Bob Templin who recently went SK.
He got it off a Houston TV station when they upgraded. Bob wanted someone
who would appreciate the mast and not just junk it. Moby is street legal, and the
mast works, all else is what you would expect from a 1987 1 ton van.

The mast itself sets on berings and can be turned. It is a microwave van and
that is what I use it for. I loan it out to some of my fellow HSMM developers
when I cannot get out in it. It is available for emergency ham radio use in
our area. If there is an emergency, either I will have it in service or will give the
keys to another ham and have them put it in service. It will not be idle during
an emergency.

During regular times I just use it as a 40' mast at the house. I had it up today.

So you can see I am pretty serious about making this microwave HSMM system work. I have focused all my resources on making it go.

As with all radios, a good antenna makes a big difference.

It is big and a bother to move at times but I usually use a 24dB BBQ grill dish with a 11dB omni above it on the mast on Moby Dick.

Other free good stuff

download inSSIDer. It runs on windows and shows you 802.11 wireless devices in your area. This is a must have. Also google and down load the older "NetStumbler" if you do not have it already. Load this sw on your laptop hook up an external antenna for your wi-fi card and hook up a GPS and drive around collecting the coordinates of wi-fi devices in your area. Very good to know what you are working with in your area. Some know of these free programs, but some do not and they are too good to pass up. Super handy.

<http://www.metageek.net/products/inssider/download>

<http://www.netstumbler.com/downloads/>

As for the ALS, it causes me to focus and appreciate each day.
Help me get this HSMM stuff over the top and we will declare victory ;-)

Glenn,

I was really sorry to hear about your health issues. Lets hope the doctors are wrong.

You mentioned a high gain omni antenna. Do you have suggestions for specific antennas?

Subject: Re: [ntms-hsmm] New togroup, need info

Doug,

Handling multiple Internet connections into one mesh is not handled automatically

in the current firmware. It is one of the many things on the list for later firmware.
We made the one link trivial and more code is needed to sort out multiple links,
do load sharing etc, and there is only so much room in the memory of a WRT54G
for code.
We typically choose to link to the Internet via our private Internet link in the City of
Austin EOC. This link has redundant connections to the Internet and is completely
separate from all other Internet links in the building.
Field operators can check if there is a live link and inject one as needed. If they
see more than one link they can contact operators and get them to add or remove
links as needed.
Sorting out multiple Internet links, determining dynamic Quality of Service
and load splitting are non trivial tasks, but are on the "want" list for future firmware.
The WRT54G normally runs with two antennas in diversity mode, it simply
switches (very rapidly) between the two antennas and talks to a node on the
antenna on which it received your last signal. Aim two directional antennas in
two different directions, and the radio will sort it out automatically, choosing
the correct antenna. No user intervention needed.
If you need more directions add more mesh nodes aim the directional antennas
and cross link them with the wired connections on the back of the mesh nodes.
We are getting into discussing a mixed network. We find with 11 dB omni antennas
WRT54G routers will link at over 7 miles with no amp. Make it 3 to 5 miles between
nodes and you operate as a true mesh when you have a minimum of 3 nodes.
If you have less than 3 nodes in your network, you have, by definition, a point to
point link. The same firmware will work fine, but you need more nodes within RF
range to have an actual mesh.
Distances mentioned are with good Line Of Sight
paths with clear Fresnel zones. Amps do little good if the path is not there, unless
you have enough power to burn a hole in what is in the way. If so, when the smoke
clears you may have a better link. One watt bidirectional 2.4GHz amps are sold in

the Austin area for $69.00 by Discount Electronics. They are on the web. If you have to run more than 0.5 to 1 watt you need to seek a better path, the power is just going to make a mess and not get your signal where you want it.

We do 10 miles, at will with no amps across hundreds of thousands of cordless phones, wireless computer networks (thousands around the U.T. campus) and microwave ovens. Just use high gain directional antennas, aim them carefully (a whole presentation) and clamp them securely in place. These links are made a will with no amps.

If the links get too far apart, you are talking about a point to point link.

You could put up multiple radios at each end and if one died the others would automatically take over. So put two like mesh nodes on each end, with independent power and antennas, and you have a redundant link with auto switch over.

For 1 to 5 mile hops we recommend vertical polarization of omni directional antennas to form a true mesh. If you set up a point to point link we recommend horizontal polarization.

Thanks again Glenn and I am downloading the book you recommended as I write this.

I did not mean to imply that there was a problem with not using AMPRNET addresses. In fact in face of the way things work in Mesh and also in real life the AMPR addresses may really not be that important. I think it is turf that they are desparately hanging onto and it made more sense in the RF packet days when we were not that Internet connected. The problem with a class A network like AMPRNET is that it really only should have one connection to its superior network. I am not sure how that would work in the Mesh topology. It probably would not. If you originate at 44.x.x.x packet on the Internet it goes to a computer at UCSD.edu and then if there is routing there via a virtual connection to that particular piece of the 44 network. There is very little real RF out there anymore. At one time we had hundreds of AMPR TCP/Ip station just here in Philadelphia and none today.

How does Mesh handle multiple Internet connections within a single Mesh network? It seems that for redundancy that would be important.

How does Mesh handle the situation where you, for example, have 3 nodes, A,B,C in a triangle, all we will say 10 miles apart, good path. If you use a direction antenna at each node, it would point at just one other node. Would you need two 54's and two antennas at each site? If so how would the two connect? Via cable or residual RF?

Subject: Re: [ntms-hsmm] New togroup, need info

Doug,

The HSMM-MESH is a cutting edge self configuring, self healing network. It is

new stuff and a very, very, very large world in itself.

As configured, there is absolutely nothing that would keep your from using

HSMM-MESH, unaltered, in your organization. There is also nothing whatsoever,

that would keep you from linking into AMPR IP addresses.

We are currently using IP v4 with special code to take care of things IP v4 never

considered or provides a solution for. We are currently working to move to IP v6.

IPv6 has some provisions for mobile links that come and go.

If you get into the details of some key aspects of allowing for mobile and mostly

not connected nodes in a network you will see what the academics are working on with

DARPA on Disruption Tolerant Networks, Mobile Ad Hoc Networks and similar

networks like HSMM-MESH(TM)

Some of the core things of interest to us have to do with dynamic automatic linking

and dynamic automatic rerouting of streams of data.

With multiple mesh nodes linked, if one node goes down, the mesh automatically

routes the data through another mesh node, with absolutely no user intervention.

The mesh network is NOT the Internet. Although it can be spread out, due to

the distances some of the links can have, it is useful to view it as a private network

in one room of your house.

So the vast majority of what the mesh network does has nothing to do with

AMPR addresses. Once the data made it to a network where AMPR has a context, you can pass the data using AMPR addresses if you wish.

It is important to use addresses within the mesh that are not forward-able on the open Internet. Again, the mesh is not the Internet. It can be connected if you like, using an AMPR address, but it can run completely stand alone.

The local AMPR administrator, N5SMN is active in our work, and we had the AMPR discussion several years ago and there is nothing we are doing that would keep you from using AMPR addresses in the context where they are relevant.

Much of what we are doing with HSMM-MESH will have some support in IPv6, and we are moving to IPv6 in later firmware. Current firmware is IPv4 based.

The IPv6 work has been in progress

for about a year at this time. There is nothing in IPv6 that does much to change anything with AMPR assigned addresses. If you know of changes, let me know.

There are references to OLSR and key IPv6 considerations on the wiki link I sent.

I think once you dig in a bit deeper, you may find the mesh work is much more of a very, very large new world, than a minimal implementation of existing technology.

Except for not turning on strong software encryption, HSMM-MESH is much closer to military mesh systems than existing network systems.

One way to look at it is that on the WRT54G, there are three separate networks.

The 4 port switch connections are one network and tie into existing networks, using conventional computer LAN network techniques. The wired WAN connection can be used to tie into the Internet using traditional WAN techniques.

The RF network is where all the new stuff is and it differs, significantly from the way things have been done in the past. Optimum Link State Routing is used as a new link level protocol, and that is where we do our unique addressing. If you read up on OLSR, you will see why the addressing scheme on the RF network works like it does.

The programmable router function of the WRT54G defines how the three separate

networks in the box are cross linked. The way the three networks operate with HSMM-MESH(TM) firmware is different than the way they work with the factory firmware. If you check into the 802.11b specification, you will see that all nodes using an Ad Hoc connection, use the same SSID. The OLSR mesh scheme uses a modified Ad Hoc link model. HSMM-MESH is what we chose to use for our system. Again this is part of the IEEE 802.11 spec. If you change this, and you can, your system will not link to ours. That may be what you want, but you need to understand the implications.

So we had to pick a SSID, but it is related to an 802.11 spec requirement, and not an attempt to brand the system to any organization. That is why we picked HSMM-MESH as the name to have a generic name.

The name can be changed to the name of your organization. That is configurable on the set up web page provided by HSMM-MESH firmware, served up from inside the WRT54G. We can and have set up multiple mesh networks with different network names. The channel you operate on can be changed as well.

But as one

example of the extreme flexibility of the HSMM-MESH design, is that you can have two mesh networks, operating on the same channel, using different SSIDs. It works. There are collisions as you would expect but I have run two different mesh networks on the same channel and passed live video over both of them at the same time, and it works fine. You have to get out some test gear to see the collisions.

As I said, this is more of new world, than just picking some addresses and putting your call sign in as the SSID. Working on channels 1 - 6 and setting the SSID to your call sign IS HSMM. It is just a simple version. We are doing a bit of a different type of HSMM. There are countless other ways things could be done and still be considered HSMM.

The changes to the WRT54G firmware have involved some significant heavy lifting to come up with HSMM-MESH(TM) and that is why we trade mark the system. We make it available for free, but it is not just a name, it is a quite involved system,

developed over a period of about 8 years. We kept a low profile until we had a complete working system.

If you will use the system in the way we have designed, it, your systems will link. You are free to make whatever changes you like, but if it does not follow HSMM-MESH guidelines, we cannot help you or guarantee, that data can be passed, your are on your own. Make sure that is what you want to do.

For example, you can go in and make a bunch of changes to APRS, but if you do not follow the design guide lines, your changes may be unique to your system and not work with the rest of the APRS system.

So the place where AMPR probably would make sense to use, is on the WAN port. Since it uses traditional networking techniques, no changes are needed.

Set the address to an AMPR address if you like, and deal with the benefits / implications.

We are in the process of using HSMM-MESH to link the City of Austin EOC, area hospitals and other "sites of interest". Being in the Capitol city means there are quite a few "sites of interest". So ham ecomm may be on the way out in many places, HSMM-MESH will cover the Austin area.

Also, I have not mentioned mobile links. With the fast auto linking, it is possible to pass messages as we drive by a fixed HSMM-MESH site or even another mobile unit. We have passed live video and many megabytes of files as some of the key developers travel to and from the Texas Star Party. Live video between vehicles at 80mph on I-10 in west Texas is a hoot.

The HSMM-MESH developers work with other hams at the Texas Star Party to pipe in the Internet to a guest ranch near Ft. Davis in west Texas. The TSP attracts about 800 astronomers to the foot hills around the McDonald Observatory (where I used to work). The hams bring in the Internet then set up a hybrid 802.11a / 802.11g network to provide Internet access for all the astronomers for a week. It has been a great training ground for our mesh development work.

Do a google search for Texas Star Party. We run a special events station for a week

from the very well equipped TSP ham shack on the Prude Guest Ranch.

To vastly expand the flexibility of the system as well as making it more complex, any

of the wired network connections on the WRT54G mesh nodes could be connected

to other RF network system. As flexibility and how many different ways the existing

HSMM-MESH system could be configured grows, complexity approaches infinity.

A limited subset of all possible ways to configure the system are the ones useful to focus on.

Again the information on the wiki and the many links to other references, covers

how the system works.

I hope this brief summary is helpful. Beyond this, it is probably good to dig into

the info on the wiki.

Thanks for your interest.

Yes, please encourage people to check out the grid grid squares in an area they might like to deploy a mesh, and see how many hams in in most cities.

It is not a done deal, but the basic resource for a ham only mesh is in place. It would take a while, but hams could have pocket nets all over U.S. cites and link them via wired Internet connections.

Kip,

It is tremendously helpful to have you do these HSMM seminars.

We hope to have our web page on line soon. At that time I will
consider new ways to promote HSMM. Part of the answer is to
establish an "expert" in each geographic area. Travel beyond
some distance is just too much to overcome.

Your training materials could be part of a package to supply
area "experts". Give it some consideration. I want to find a way
to support HSMM hams in other states and I do not have all
the answers yet but documentation will be needed.

Would it be possible to video tape your presentation?
Perhaps we could create a DVD starter kit.

Give it some consideration and let me know if you
have any ideas.

Thanks,

Some of the people from out of town have asked for the presentation

materials. The presentation for this next seminar are not finished.

But from last year they are Located:

Oh well, just as well it went out.

We need to get enough info to trainers that are not in the Austin or Dallas area. It is interesting stuff, but it does take time to work through the slides, find a meeting place and do the presentation.

What I hope to do is work up presentation materials and continue to refine and update them.

Some folks are well to do and buying a couple of WRT54GL routers for testing and giving demos, is not a problem.

I buy used but working WRT54G routers from the Goodwill Computer store here in Austin, Tx. Goodwill is a job training outfit. They got linked up with Dell Computers here in the Austin area (actually the head office is in Round Rock, a few blocks from my house) to do computer recycling.

Goodwill stores usually resell used household items and cloths, but there is a special used computer store here in Austin. Sometime all is junk and sometimes you find some real deals.

I buy used routers for $25.00 plus tax. I eat the tax and sell the routers for $25.00 to help people get on the air cheaply.

I have let a lot of people borrow gear for testing and demos. Millions of the WRT54G routers were made and I have found good homes for about 40 used ones. I may be able to make a few routers available in a teaching / demo kit.

The WRT54GL is still made and has the best hardware inside, but it is $60.00 and you need two just to do any testing and 3 to form a minimal mesh where you can see routing change at times.

My supply ebbs and flows. Right now I am a bit dry but hope to see more used routers show up at Goodwill as new gear received at Christmas gets installed.

Thanks for your interest. We have to continue to find new ways to get the HSMM info out.

Kip,

It is tremendously helpful to have you do these HSMM seminars.

We hope to have our web page on line soon. At that time I will

consider new ways to promote HSMM. Part of the answer is to

establish an "expert" in each geographic area. Travel beyond

some distance is just too much to overcome.

Your training materials could be part of a package to supply

area "experts". Give it some consideration. I want to find a way

to support HSMM hams in other states and I do not have all

the answers yet but documentation will be needed.

Would it be possible to video tape your presentation?

Perhaps we could create a DVD starter kit.

Give it some consideration and let me know if you

have any ideas.

Thanks,

-Glenn

Well John helped me with all his HSMM presentations.

I have a friend that does professional audio and video mastering.

If you make a tape of the seminar, we can try to edit it and then
burn DVD copies. Some on the HSMM lists have offered to host
large files (a video DVD would be gigabytes), but we could
mail them out.

I am still in the queue to do a DVD overview of HSMM-MESH.

I am trying to figure out how to best schedule my efforts to do the
most good in getting the word out on HSMM. Perhaps I should
pull the HSMM DVD project off the back burner and make it more
of a priority.

Doug,

I sent you an email off line. Sorry to post this to the group, but you had mentioned that my messages were going into your spam filter. Take a look and see that you got a new message form me.

And if others what to try to help promote HSMM in your area. Let me know, we are trying to figure out how to get the info out better to hams that are not in Texas.

We could consider doing seminars at some of the larger hamfests if that would help.

Any of you out of Texas folks make it down for Hamcom?

Different types of presentations work better for some people than others. Would a power point on DVD with a few video shots of equipment and operating methods be helpful? It is work to produce such a thing. If it would not be all that helpful, then it would be better to put the effort in on something else.

Ideas are welcome. Thanks for your interest.

Topic: 1759 Message: 1760

Doug,

At www.fab-corp.com, look at the cable section for "pig tails" . These are short cables used to go from the router and bulkhead mount to the bottom of the box.

The WRT54GL has Reverse TNC male connectors. Get Reverse TNC male to N female bulkhead "pig tails". Mount the N female through a hole in the bottom of the water proof box.

Run a N male / N male feet line to the external antenna.

All the good sturdy outdoor antennas have an N female connector.

Wrap all connectors in sealing tape.

The other popular connector on the back of wireless routers is the Reverse Polarity SMA connector.

The Reverse TNC and Reverse SMA connectors are similar to standard TNC and SMA connectors, but the pins are reversed in the connectors.

Initially the FCC told the Part -15 makers to put non standard connectors on the devices so it would not be straightforward for non licensed users to add external antennas.

Ironically now, there are probably orders of magnitude more of the "non standard" Reverse TNC and SMA conectors than the original standard connectors.

Check the connectors carefully. Fab Corp has real good photos of the different connectors so you can sort them all out.

Many vendors sell "pig tails" I get mine from www.fab-corp.com.

Be careful with feed lines. A 10 foot feedline could kill all your signal, unless it is super good cable. I try to use good Times Microsystems cable and keep the run from the router to the antenna under 5 feet total.

Dave,

Great! It has a lot of good info. There are quite a few topics you need to know about to get on the air with HSMM. It does a good job of telling you enough about each of them to get you going. You can always dig into the references if you like, but it is a good read an they keep things rolling to show you the short path to get on the air.

When you have time to check it out, drop me a message with what you think they left our or what ham specific info hams need that was not covered.

I will attempt to fill in the gaps. Who knows, with enough gaps filled in, I may be able to stitch together a ham specific wireless networking book.

For now, happy reading and happy meshing.

Glenn

Thanks for the link.

I had a quick look through the TOC and the book and it looks

excellent... ..it is especially nice to see the DIY projects!

I know in my part of the world where the Internet is practically in every home, it is difficult to motivate HAMS to use Packet because of the speed challenge... ....the only time the low speed RF networks are used is during emergencies and then the very low bandwidth and congestion is an issue.

This may be a good solution for both backbone and LAN.....I look forward to reading the book.

Regards

Bob

Subject: Re: [ntms-hsmm] Free book on Mesh Networking - must read

If you have any interest at all in HSMM, you need to down load this free book.

<http://wndw. net/download. html>

This book tells how to set up a mesh network in a developing country, which is about 99% the same job as setting up a HSMM network in that you have to supply all the infrastructure.

This book tells you how to set up a nice mesh network.

They cover all the key things you need to know. They discuss using the WRT54G. Just use HSMM-MESH firmware instead of the similar firmware they mention and you have a 425 page book that tell you what to do to set up a mesh network.

Again, if you have ANY intrest in HSMM, you need to take a look at this free book. It pretty much explains what we have independently developed in the Austin HSMM SIG, except we have developed a our own custom firmware and done

crystal mods.

Kip,

How will you connect it to the WRT54G (via an adapter)? Where can you get the adapter? I would buy that antenna right now if I knew I could cheaply attach it to my router.

Thanks Glenn,

What is your experience with the omni antenna and mounting? Specifically side mounted on an outrig on a tower. I am sure this distorts the pattern and probably shadows it on the opposite side. Maybe two antennas on opposite sides?

Doug

Subject: Re: [ntms-hsmm] Antenna connection

Doug,

At www.fab-corp. com, look at the cable section for "pig tails" . These are short cables used to go from the router and bulkhead mount to the bottom of the box.

The WRT54GL has Reverse TNC male connectors. Get Reverse TNC male to N female bulkhead "pig tails". Mount the N female through a hole in the bottom of the water proof box.

Run a N male / N male feet line to the external antenna.

All the good sturdy outdoor antennas have an N female connector.

Wrap all connectors in sealing tape.

The other popular connector on the back of wireless routers is the Reverse Polarity SMA connector.

The Reverse TNC and Reverse SMA connectors are similar to standard TNC and SMA connectors, but the pins are reversed in the connectors.

Initially the FCC told the Part -15 makers to put non standard connectors on the devices so it would not be straightforward for non licensed users to add external antennas.

Ironically now, there are probably orders of magnitude more of the "non standard" Reverse TNC and SMA conectors than the original standard connectors.

Check the connectors carefully. Fab Corp has real good photos of the different connectors so you can sort them all out.

Many vendors sell "pig tails" I get mine from www.fab-corp. com.

Be careful with feed lines. A 10 foot feedline could kill all your signal, unless it is super good cable. I try to use good Times Microsystems cable and keep the run from the router to the antenna under 5 feet total.

Assuming a WRT54 in waterproof box with 11dbi omni. What is the best connection method? Do you put a bulkhead on box or just bring coax out the bottom and seal? What type of coax? Do you use an N to tnc? or whatever is on the router, adapter?

Glenn,

I think these two items would work. I was looking for a little shorter. Total length is about 5.5 feet, 19" for inside and 48" outside. I did not see anything suitable that was shorter. Do you think this would be too much loss?

It will probably work fine. You have to have the 100 for inside the box
because it is flexible. Then the heavy 400 for outside to the antenna.

Let us know how it works.

1771. Typical ethernet connection

Yahoo group: DAWG-HSMM
Date: 2010-01-18 17:20:36 UTC
From: Mr Doug -
Topic: 1771 Message: 1771

OK next question. How is the power/ethernet connected in a mast mounted waterproof box? Does the WRT54 support POE? If not do you externally use an unused pair in downlead?

As a for instance if one were to mount this at a home QTH what would you bring down from the box? Would the connection be to LAN? I suspect this would be the important one as it would give web access. What if you want to have it as in Internet point of access?

Doug

Doug,

That looks like a workable set of cables. Fabcorp tests all their cables which is a big help. I do not mess with trying to make the pig tails as the tiny connectors are too easy to mess up. For the LMR-400, I usually make my own custom cables.

As for the side arm mounting, you can go with two antennas and make use of the diversity antenna switching the router does. The tower will create a noticeable shadow but the two antennas will get around that.

We have found that getting good Line of Sight is often more important than keeping the feed line short, when you are are talking about a few feet. The better placement may swamp the loss in the extra cable, if you can get your antenna in a sweet spot.

Many of the consumer routers have two antennas. These things are super cost reduced. They can afford to make design changes when they make runs of hundreds of thousands. They would leave off the antennas if they felt they could get away with it. Consumers often no not pay attention to good antenna placement, and they depend on the diversity antenna system to keep things working as people walk a round a room, metal file cabinets are in a path etc. It really helps and keeps most folks from taking the wireless routers back to the store saying they do not work. I have seen wireless routers in a computer room, antennas folded flat and buried in a pile of CAT-5 cable. It did not occur to them to put he device up on a high spot on one of the racks and stick the antennas up. They did not have optimum wireless coverage, but it was working.

Having the second antenna helps enough, often enough to spend the money even on super cost reduced design.

Many of the new wireless routers are running more power and more antennas Multiple In Multiple Out (MIMO) They do a lot of switching of the antennas. Also most now seem to have more antennas inside the case. Some of the newer wireless N routers I have taken apart have as many as 5 antennas. Some are small bits of metal and easy to spot, and others are made of circuit board traces on the main circuit board of the router.

I only have simple tools, no fancy spectrum analyzers so I have no easy way to measure what is coming out of what antenna in what mode. And of course, the maker is not interested in telling me about their design, although you can sometimes get some info by looking at the FCC type acceptance data they had to file.

The built in antennas in laptops are usually poor performers. I wish they would provide a easy to get to jack tor an external antenna. For some work, I use PCMCIA

or Cardbus Wi-Fi cards with external antenna jacks. The circuit board antennas of the PCMCIA are some of the worst compromised antennas around. I have made may 10 mile links using a PCMCIA Wi-Fi card with a 24dB BBQ grill dish attached, but I can see why the laptop maker does not sell such an antenna arrangement as a standard product ;-)

I also have had excellent results with USB Wi-Fi adapters because they USB cable lets you mover the radio / antenna around. The microwave signals tend to bounce around in some buildings, like a LASER pen in a house of mirrors. It goes all over the place, but sometimes moving an antenna a few inches hits either a sweet spot or dead spot.

Getting way off here but Velcro a USB Wi-Fi adapter in the focal point of a dish and that works well also. I use a PVC pipe to hold the USB device at the focal point and took apart the USB radio so I could figure out where the circuit board antenna was located so I could aim it at the dish when I had it Velcroed in place.

I am wandering here a bit, but if you have any way to monitor the signal strength, you can often see a much better signal by moving an antenna a few inches and the extra cable to let you move those few inches to a sweet spot are well spent. There is some loss with a bit longer cable, but the better location of the antenna more than makes up for the loss.

If you have the money, good hard line works great. I found a run of small diameter Andrews hard line at a swap fest. A 50' run of even this small diameter hard line had less loss than a 3' run of cheap extent ion cable I bought at Fry's electronics.

Andrews and others make good hard line. It is expensive, but there is a reason they have customers for the stuff. There are some cable loss comparisons on the wiki page I gave you. We will have the info on the web site as soon as it goes live.

The only real good use for an amp we have found is if you must mount the radio down on the ground and run a long feed line to the antenna. We had a repeater site that had 300' of hard line to the top of a tower and the amp helped overcome the signal loss in the feed line. The reason this works well is the amp provides gain to noise as well as signal, but it is real quiet inside good feed line so there is not much noise to amplify. Running a 1/2 watt amp gave us coverage from the tower out 7 miles in most directions. The rest of the story is it was a 900MHz vertical omni antenna and we were squirting 2.4 GHz through it.
Less than optimum but the antenna was in place and an inviting N
connector terminated feed line just hanging
down in the radio shack with nothing attached to it.

So that story is good field experience. One would always like to use just he right gear, but with a 1/2 watt bidirectional amp, we were able to make good use of a spare antenna up on a 300 foot tower. At 1/2 watt, were were not worried about melting anything, even with bad mismatches. From such a high location we really did not need much power to make a link.

I have a 10dB patch antenna on top of my car and could link from 7 miles away, by carefully driving around the local Fry's Electronics store parking lot. I would get

to where I could see the tower, then slowly drive a slightly weaving pattern (carefully) through the parking lot until I found a sweet spot. It is a bit like drunk driving but is more properly called geek driving I think. I was in a parking lot and not on a road so there was no safety problem, I was barely moving and when I hit a sweet spot, I had to back up about 3 feet at times to make sure I hit it just right.

I was able to use the same driving technique to link with the 300 foot tower, from several parking garages in the area. Be safe when doing such testing, but it is fun and if I ever have to put up portable links around town, the experience will come in handy. Once a sweet spot is found, you can put a tripod mounted mesh node in the spot and have it work.

Near the tower the signal was easy to find and did not take any odd driving around. The technique described above is helpful when you are on the ragged edge of not being able to link.

Good questions.

The WRT54G does not come from the factory set up for POE but it is easy to solder jumpers on the WRT54G to do a form of "passive POE" the yahoo site you just joined has photos of how to do this. This too will will go on the website soon.

But if you do a Google for POE you will find many hits and photos on adapting a WRT54G for POE.

Formal POE is IEEE 802.11af and you can buy a kit with a little box for each end of a CAT-5 that puts power on unused pairs of wires in a CAT-5 cable. A kit costs about $50.00 I have used them and they work fine. But the formal 802.11af uses 48 VDC to make sure they have enough power on a 100 meter run. Also 802.11af is formal POE and it requires smart circuits. The POE injector must detect a POE device before suppling power.

We are just careful and split out unused pairs and run 12VDC up the cable.

If you want to be able to have access to both WAN and LAN ports, you probably need to run two CAT-5 cables. That is what I did at the City EOC so down in the shack, I can run off the LAN side of the mesh node most of the time, but have the option of being the one to inject Internet into the mesh by putting an Internet link in on the WAN side.

Google the Wikipedia POE for good info.

I wouldn't worry too much about loss on those jumpers. I use similar on point to point microwave equipment (2.4 - 11G) as a transition to waveguide. Whatever loss is compensated in your path loss calculations when sizing and mounting antennas. Assuming that your next point of connection is your antenna, it's nothing to write home about.

1775. HSMM-MESH(tm) info and examples of use

Yahoo group: DAWG-HSMM
Date: 2010-01-25 05:02:06 UTC
From: Glenn Currie
Topic: 1775 Message: 1775

If you are interested in HSMM please check out the following
links to useful documentation:

<http://www.n5oom.org/hsmm/>

<http://wndw.net/pdf/wndw2-en/wndw2-ebook.pdf>

The Austin HSMM SIG developers are currently swamped answering
questions. We hope to have a web site up soon. Until then
we will answer questions and requests for documentation as best
we can in our spare time. Thanks for understanding.

--

To understand and use a HSMM system like HSMM-MESH(tm) it is
necessary to understand something about radios and something about
computer networks. The second URL above is a book that covers
enough to get help you get started.

Once you have a HSMM-MESH(tm) on the air, the vast majority of the
work is that of a computer system administrator. To most, the
whole HSMM-MESH(tm) network seems to just be a big network. The
fact that some links are ham radio links it almost entirely
transparent to the system administrator. So once you have
HSMM-MESH(tm) up and running most of your questions are standard
computer network questions. The more you understand about
computer networking, the easier running HSMM-MESH(tm) will be.

Please understand that if you have limited networking experience
such as setting up a web page, configuring an email server,
keeping remote file systems on line, setting up VoIP telephones,
etc. are all computer networking questions, not HSMM-MESH(tm)
questions for the most part.

It can take years to learn how to do the tasks listed above and
there is no easy way to gloss over he chasm. Somebody needs to
know this stuff to make your HSMM-MESH(tm) system work to its
fullest extent.

Just as most hams do not set up repeaters or a D-STAR system.
most users of a HSMM-MESH(tm) system will not need to know as
much as a system administrator. But you need at least one good
system administrator to make a HSMM-MESH(tm) system work.

Some key concepts of HSMM and a specific version of HSMM called
HSMM-MESH(tm):

Here is one popular question that is some what self contained:

1.How do I do the WRT54GL crystal mod?
That is showing up in the next issue of CQ-VHF magazine. We have put a lot of effort into getting that info out and K8OCL is helping by including the mod with photos in his CQ-VHF magazine column on HSMM.

General concepts of HSMM-MESH(tm)

HSMM-MESH(tm) is ham specific firmware written for the Linksys WRT54GL wireless router and similar hardware. You load a HSMM-MESH(tm) firmware file instead of an update from Linksys. Linksys provided the gateway in for loading updated firmware.

The standard Linksys WRT54G firmware does enough to fill a large book. There is such a book.
HSMM-MESH(tm) significantly changes the way the WRT54GL works when the firmware is loaded.

Key changes include automatic linking between nodes when they come within RF range. In about 5 seconds they link and are ready to pass data. No setting of IP addresses or any other configuration is needed. This is the RF network of the WRT54G hardware.

There are two other networks in the box. A 4 port LAN and a single WAN port. These are physically RJ-45 network cable jacks. The firmware in the WRT54GL is configurable, and defines the interaction between the two wired and one RF network.

Lets use an example of 4 mesh nodes. Turn them on and all the nodes will link automatically on the RF network. In this configuration you have 4 blue boxes linked and ready to send data but that is about
it.

This is about the same as taking 4 wired only, network hubs / switches and plugging CAT-5 network cables between them. An Ethernet hub / switch basically fans out a single RJ-45 jack to several, so
you can plug in more devices. With the hubs linked you have a live network but nobody to send any thing. All that is going on is a few service packets are getting passed around between the hubs to say they are connected, I am connected, I am connected, I am still connected...

So this is a complete working network but not of much interest to most people. Now what is going on to make a radio link look like a CAT-5 computer cable is actually profoundly complex. But in the end then RF link preforms exactly the same function as a simple cable.

The auto link feature on the RF network might be compared on the wired hub example as “wires that plug themselves in” and if they fall out, they “plug themselves in” again with no user intervention.

So a bare bones HSMM-MESH(tm) network is quite a piece of work, but no user data is flowing and most people would consider it “useless” to them. (EME, moon bounce contacts are quite a technical
feat but of no interest to most of mankind.)

Application programs for the network:

Well in both our simple wired and wireless network examples we have working networks but no user data is flowing unless we plug in some computers into the network. This may seem obvious, but it is
important to note that HSMM-MESH(tm) is just the network and it runs using ham radios as links, but it is just the network. You must hook up computers and application software to do any thing of interest to most people.

Anybody heard of the popular Apple iPhone? Want to do anything? There is an app for that. Well on a wired or wireless network, if you want to do anything useful, you need an app for that. Want to send email, you need an app for that. Want to transfer files, there is an app for that. Want to look at web pages? There is an app for that. You get the picture. Once you have the basic hardware in place and have a network link, you need application software to do anything that most people would consider useful.

HSMM-MESH(tm) can run completely stand alone. But if you want to send email, talk using VoIP phones, send pictures, view web pages, read email, someone will need to supply the application software and the computer it runs on, and will need to attach that to a LAN port on one of the mesh nodes. We are in the process of setting this up in Austin.

HSMM-MEAH(tm) has been carefully crafted to that it can easily attach to the Internet, but it is VERY important to understand that it does not need to attach to the network to be useful. We are linking hospitals in Austin. If other communications (phones and the Internet) were down we could still use HSMM-MESH(tm) but we would need to supply the mesh nodes and any computers needed to do something of use on the network.

We already have ARCHES voice and packet stations in about 40 hospitals and clinics. The stations have two dual band radios, 2m / 70cm. One is generally used for voice, and the other is used for packet radio using a TNC. The packet radios can link and send out messages via Winlink and Airmail. To support the TNC, and the Winlink software there is a computer in addition to the two radios and TNC.

With the HSMM-MESH(tm) addition, we can plug a wire form the Ethernet jack on the PC at each station and link to the other hospitals the Red Cross and the local EOC (all in progress of being installed). We have our own servers at the EOC with back up power and it can and will host our application software so we can run without the Internet so we can send email, talk on VoIP telephones and trade files at high speed.

How do you update the software on 40 computers with 5 or 6 hams doing all the work. Well the rest of the world regularly downloads updates over the Internet. We plan to do updates over HSMM-MESH(tm) once it is fully installed. We will be able to pull up in the parking lot of a hospital and tie into HSMM-MESH(tm) and access all the computers on the network, and down load software or do other administrative tasks, without having to show anyone our (stinking badges) . We do not need
to access the buildings for may maintenance tasks.

Providing a temporary Internet link to a hospital example:

We have a dedicated, static IP address for the ham shack in the City of Austin EOC ham shack. It is ours. Nobody else in the building in on this Internet link.

Now consider the situation where a back hoe digs up and breaks a big phone cable and a hospital looses their Internet connection.

It would be possible to plug our EOC Internet connection into a mesh node on the roof of the EOC and make the Internet available to all mesh nodes in RF range. Say the hospital that has just lost Internet connection has a solid HSMM-MESH(tm) link to the EOC. The ham at the hospital ARCHES station could contact the hospital system administrator and hold up a CAT-5 cable and say “I have a live Internet connection on this cable. Do you want to plug it into your network? Your choice.”

So HSMM-MESH could be used to bridge a broken Internet link if a hospital lost their link. This is classic ARES work – providing communications when other links are down. Traditionally this has meant phone lines. But ALL our served agencies use the Internet extensively. To them it is NORMAL communications.

There are countless other examples of how HSMM-MESH(tm) could be used. I hope these few examples have been of some help in understand what HSMM-MESH(tm), a very specific type of HSMM communications is “for”.

1776. HSMM-MESH(tm) web site is LIVE on the Internet - hsmm-mesh.org

Yahoo group: DAWG-HSMM
Date: 2010-01-27 00:50:08 UTC
From: Glenn Currie
Topic: 1776 Message: 1776

We now have a web site on line for the HSMM work going on
in Austin and Plano areas.

hsmm-mesh.org

We have massive archives in our unlisted yahoo group and on a
previous unpublished wiki web site.

We made a Herculean effort to get the technical side of getting a
page on the Internet and will fill the site with more content
ASAP.

For now, follow the "Key Concepts" link to the HSMM Wiki where
you can down load the HSMM-MESH(tm) firmware and read the
documentation on how to use it.

We will move most of our archives from our unpublished HSMM
development Yahoo site to the web page for general use and go
back to using the developer Yahoo site for those working on
the firmware and other key development efforts.

Check the web page regularly. Now that it is on line, we
will be adding content ASAP.

Thanks for the patience of many of you who have been waiting
for information.

1777. Join us for HSMM-MESH Networking Webinar Saturday, Feb. 6, 2010

Yahoo group: DAWG-HSMM
Date: 2010-02-01 19:40:33 UTC
From: Kilgore
Topic: 1777 Message: 1777

Please disseminate to all ham club members.

HSMM-MESH(tm) Networking Seminar

The HSMM-MESH(tm) Networking Seminar will cover all aspects of the HSMM-MESH software developed in Austin, TX. The Webinar will begin with an explanation of High-Speed Multi-Media (HSMM) and the subset of this topic which uses modified Linksys WRT54GL 2.4 GHz Wireless Routers to form a mesh network, handy for high speed digital communications in the ham band - for emergencies, special events and field day.

The Webinar will cover applications, antennas, hardware, and the software. You will learn how to load the software and how to configure it.

In the second part there will be a lab where we will actually load the software into a router and configure the router. You will need a Linksys WRT54GL (any version) or a WRT54G (Version 1.1 through 4 - version 5 or higher
will NOT work.)

The Webinar will be online at 8:00am Central time to give you a chance to get logged in and test your setup before something starts happening. Training starts at 9:00am with 10 minute breaks about every hour. And we will finish in the afternoon after a lunch break.

You should Register before Saturday morning if possible. . If you have a microphone and headset you will be able to ask questions verbally over VOIP. Otherwise you can type in questions to be able to interact with the speaker.

The Webinar is provided through the courtesy of Ham-Com and is presented by members of the NTMS-HSMM and Austin-HSMM groups. (contactkip@...) hsmm-mesh.org

Join us for a Webinar on February 6

<https://www1.gotomeeting.com/register/959766065>

Space is limited.
Reserve your Webinar seat now at:

I had to look at this twice. The antenna is 2.4 meters big, and talks to satellites. It is not a 2.4 GHz antenna we can use for HSMM-MESH.

They do provide a high speed Internet link that could be used by the HSMM-MESH.

From: kc5qhh
Topic: 1786 Message: 1786

Cross Post from HF Link Yahoo Group - Thanks to Bonnie Crystal - KQ6 XA

USA's FCC will webcast this meeting:

Public Forum to Create an Emergency Response Interoperability Center

February 10, 2010 2:00 PM ☐ 4:00 PM ET | Washington, DC

http://reboot.fcc.gov/live/

The Public Safety and Homeland Security Bureau (PSHSB) will hold a public forum to discuss the need for enhanced coordination and cooperation among public safety entities to achieve broadband interoperability and operability. The forum will also discuss the creation of an Emergency Response Interoperability Center (ERIC) to develop common standards and to provide interoperability and operating procedures for the public safety licensee authorized to construct, operate and use the nationwide wireless broadband network.

I've had my (4x) AA powered notebook computer for almost 20 years - a TRS-80 Model 102. It has a built in Text Editor, Spread Sheet (Multiplan), commications interface (300 baud modem port), mass storage port (cassette interface), 4-line LCD display, 32K of RAM, and external expansion bus. Unfortunately, time has left it by as it is not Y2K compliant but hey, the battery life is about 20 hours! It still works well as a packet terminal and for debugging microcontroller projects using it's built in communications program.

Sorry, couldn't help myself!

Given that Norhtec's latest product news is dated from 2007, and the latest copyright date on their pages is 2007, I'd say their project died in 2007 and the web site is just a ghost of Yet Another Vaporware Project.

Be nice if it happened, but I think it didn't and won't.

Though I haven't measured the box, I have done two types of weather resistant mounting for HSMM equipment. The first is to use "lawn irrigation control boxes" and mount the Linksys equipment (BEF11S4, WSB24, and WET11) in those boxes. The other thing I have done is to take the board out of a WRT54Gv2 and mount it on stand-offs in a NMEA 4 box.

FOR IMMEDIATE RELEASE: NEWS MEDIA CONTACT

February 18, 2010 Robert Kenny: (202) 418-2668

Email: robert.kenny@...

FEDERAL COMMUNICATIONS COMMISSION ANNOUNCES NEW DATE

FOR EMERGENCY RESPONSE INTEROPERABILITY FORUM

Public forum on Creation of Interoperability Center Set for March 2

Washington, D.C. ☐ The Federal Communications Commission's (FCC's) Public Safety and Homeland Security Bureau (Bureau) has rescheduled its public forum to discuss the creation of an emergency response interoperability center for public safety broadband communications for Tuesday, March 2, 2010, from 2:00 p.m. - 4:00 p.m. The March 2nd meeting will be held in the Commission Meeting Room (TW-C305) located at 445 12th Street, SW, Washington, D.C. 20554. Please note that this forum had been originally scheduled for February 10, 2010, but was postponed due to severe winter weather.

Representatives from the U.S. Department of Homeland Security, the National Institute of Standards and Technology's Public Safety Communications Research Program, and the Bureau will make brief opening remarks. The floor will then be open to the audience for questions and comments. Attendees who would like to speak will be given no more than three minutes to ask questions and/or make comments. Those who are interested in speaking at the forum must notify Susan McLean, PSHSB Outreach Coordinator, at Susan.McLean@... no later than noon on Friday, February 26, 2010. Due to the limited meeting time, speakers will be given time to speak on a first come, first served basis. All information gathered in connection with this forum, whether submitted in person or over the Internet, will be made part of the record in the National Broadband Plan proceeding, GN Docket No. 09-51. Please Note: all who registered to attend the February 10th public forum and may have requested to provide public comment must re-register for the March 2nd event and again request to speak (please see details on pre-registration below).

The Bureau is holding this public forum in response to public comments the Commission received as part of the National Broadband Plan proceedings which identified the need for enhanced coordination and cooperation among public safety entities to achieve broadband interoperability and operability. The forum will examine ways in which

this goal could be achieved, including the creation of an emergency response interoperability center to develop common standards and to provide interoperability and operating procedures for the public safety licensee authorized to construct, operate and use the nationwide wireless broadband network.

The attached concept paper on the emergency response interoperability center's proposed primary mission, responsibilities and structure is for discussion at the forum. The forum will solicit ideas and comments from interested parties on these topics and the concept paper. Discussions will also focus on the center's role in accomplishing critical tasks such as establishing a public safety interoperability profile, interoperability standards, authentication, encryption, roaming, priority access, application uses and interconnectivity. The forum will also focus on the role an emergency response interoperability center would play in establishing a national framework for gateway functionality and interface capabilities, as well as a national framework for interconnectivity and compatibility of user networks.

The forum will also address how an interoperability center could help in resolving interoperability-related disputes between public safety entities, establishing standards for commercial providers to expand public safety's access to broadband services across the nation, and ensuring that grant funds are utilized efficiently.

The forum will be open to the public; admittance however will be limited to the seating available. Those individuals who are interested in attending the forum may pre-register on-line at http://www.fcc.gov/pshs/event-registration.html. Those who pre-register will be asked to provide their name, title, organization affiliation, and contact information. Individuals may also contact Deandrea Wilson at Deandrea.Wilson@fcc.gov or by phone at 202-418-0703 regarding pre-registration. The deadline for pre-registration is Friday, February 26, 2010.

Audio/Video coverage of the meeting will be broadcast live with open captioning over the Internet from the FCC's web page at www.fcc.gov/realaudio. The FCC's web cast is free to the public and does not require pre-registration.

Reasonable accommodations for persons with disabilities are available upon request. Please include a description of the accommodation you will need. Individuals making such requests must include their contact information should FCC staff need to contact them for more information. Requests should be made as early as possible. Please send an e-mail to fcc504@... or call the Consumer & Governmental Affairs Bureau: 202-418-0530 (voice), 202-418-0432 (TTY).

For additional information about the meeting, please contact Susan McLean by email: Susan.McLean@... or by phone: 202-418-7868.

- FCC -

Concept Paper: Emergency Response Interoperability Center

Proposed Primary Mission - To establish a technical and operational framework that will ensure nationwide operability and interoperability from the outset in deployment and operation of the 700 MHz public safety broadband wireless network.

Proposed Responsibilities

* Adopt technical and operational requirements and procedures for ensuring a nationwide level of interoperability, to be implemented and enforced through FCC rules, license and lease conditions, and grant conditions.
* Adopt and implement other enforceable technical and operational requirements and procedures to address, at a minimum, operability, roaming, priority access, gateway functions and interfaces, interconnectivity of public safety broadband wireless networks.
* Adopt authentication and encryption requirements for common public safety broadband applications and network usage.
* Coordinate the interoperability framework of regulations, license requirements, grant conditions, and technical standards with other entities (e.g., the Public Safety Broadband Licensee (Public Safety Spectrum Trust), the Department of Homeland Security (DHS), the National Telecommunications and Information Agency, and the National Institute of Standards and Technology (NIST)).

Proposed Structure

* Location. Housed at FCC in the Public Safety and Homeland Security Bureau.
* Public Safety Advisory Board. A board that is broadly representative of the public safety community will serve a central advisory role to ERIC. We anticipate that the board will primarily include representatives of all major national public safety organizations and regional, state, tribal, and local public safety entities. Participating Federal first responder agencies, vendors, and service providers may have secondary or ex officio status on the board.
* Participating Federal Agencies. We recommend that DHS and NIST contribute to ERIC's functions in their traditional areas of expertise via Memoranda of Agreement with PSHSB and potential staff detail assignments to ERIC:

* DHS would participate in the areas of grant administration, public safety outreach and technical assistance, and best practices development.
* NIST would participate in the areas of standards development, verification, testing, and validation.

Federal Partners Coordinating Committee. Federal agencies that regularly coordinate on state and local public safety communications matters (e.g., DHS, NTIA, DOJ) will have the opportunity to provide input into ERIC specific to 700 MHz broadband deployments.

1796. ARRL/TAPR 2009 Digital Conference DVDs Now Available

Yahoo group: DAWG-HSMM

From: Mark Thompson
Topic: 1796 Message: 1796

ARRL/TAPR 2009 Digital Conference DVDs Now Available
Posted by: "Gary Pearce KN4AQ" kn4aq@... kn4aq
Date: Sat Feb 20, 2010 8:18 am ((PST))

ARVN has released a new 6-DVD set of videos from the ARRL and TAPR 2009 Digital Communications Conference, held last September near Chicago.

This year's conference didn't have as much D-STAR info as the 2008 DCC did. Tom Azlin N4ZPT has a presentation on using the DD mode and ID1's at the Marine Corps Marathon, and John Ronan EI7IG has been experimenting with what he calls "Delay and Disruption Tolerant Networking in AX.25 and DSTAR Networks."

Other topics presented include: equipment design and construction, Software Designed Radio, AMSAT/ARISSat, packet, advanced APRS, and Digital ATV. It's all interesting, but I found the Digital ATV presentations to be particularly new and intriguing.

The six DVDs are organized around common topics. Each DVD has several presentations, and most presentations run about 45 minutes (good for club meeting programs, if your club leans a bit technical).

You can buy individual DVDs covering the area you're interested in for $15 each (+ $3 shipping), or the whole set for $75 (but still just $3 shipping). The DVDs are produced in NTSC standard definition video.

And a reminder that DVDS of the D-STAR presentations at the 2008 and 2009 Dayton Hamventions are also available. If you find yourself hungry for more D-STAR information, these DVDs should help fill you up (or at least keep you busy for a day).

Free previews, details and ordering at: www.ARVideoNews.com.

1798. Basic Setup: Do I need to open ports?

Yahoo group: DAWG-HSMM
Date: 2010-02-25 02:06:31 UTC
From: kc5sii
Topic: 1798 Message: 1798

I have two WR54 routers set up they talk with each other. I can ping the distant router form one host and vise versa. But I can't ping a host on one router to another host on the other.

I think I still have some configuration to do with port forwarding. If I understand it correctly, by default, the router will not route any traffic to the LAN. I think I've figured out that I must first open ports to allow the router to pass the traffic. I'm not exactly sure how to do that. I think I might be able to muddle through setting up common ports like 80 or something. But what about regular traffic like file sharing between two XP machines and computer browsing. Is there a way just to open it up entirely for on net verses off net traffic?

Some screen shot examples would ge great. I think if I see what goes where, I'll have a better idea how to proceed.

Thanks in advance!

73,
Dave, KC5SII

Correct.

>I must first open ports to allow the router to pass the traffic.

Correct again.

>I'm not exactly sure how to do that. I think I might be able
>to muddle through setting up common ports like 80 or something.

From the status page, go to setup. After entering the password and
arriving at the setup page, click on "Port Forwarding and DHCP" at
the top.

Now, port 80 is already used by the node, on all interfaces (WAN, LAN,
and WLAN), for its webserver to configure the node. You might want to
pass another port, say 8080, but have the iptables software translate
that back to port 80 on its way onto to the LAN PC (172.27.0.xx).

>But what about regular traffic like file sharing between two XP
>machines and computer browsing. Is there a way just to open it up
>entirely for on net verses off net traffic?

You could always turn off the firewall/NAT but... if on XP machine is
on one node and the other XP machine is attached to a different node
they can't address each other. Both will probably have the IP address
of 172.27.0.10. You think, "Well, maybe I'll assign static addresses on
the LAN side." Nice try but node's router will keep those 172.27.0.xx
addresses on the LAN side. Poke holes in the firewall to go to a
particular PC on the LAN side of the node.

Port 445 is used by Micro$oft for its file sharing. See the knowledge
base on Micro$oft's website to find out what ports are used by their
software.

> Some screen shot examples would ge great. I think if I see what
>goes where, I'll have a better idea how to proceed.

I think it's fairly straight forward but holler if you have problems
or questions. OK?

No, you didn't miss anything. Until now, I didn't know enough to even ask questions. I did manage to get 3 nodes working in the house with a computer on each one. I have openfire runing on one and spark on the other 2. When the wife asked what I was doing, I had to admit I was talking to my self on the computer. :)

No biggie -- I do it all the time -- I'm the only one that listens to me. :-)

Did you compile OpenFire and Spark for the nodes themselves or the
machines attached to them?

Rusty, Gerald, and all.

The two you have brought up a very key topic with respect to the mesh. I'm a user and not a developer so my question may not make sense. I am concerned that in an "event" situation where you do not have local access to the internet, but you have mesh nodes deployed at key locations in the "event" area you will be unable to communicate to computers attached to each node. If I understand correctly you have made one computer a server for the network and that one serves all the others. Not sure how smart all of us responders are to set something like this up. If the mesh nodes are all within its network could something as simple as the program LANChat on each computer work for node to node communications or something similar that is small enough to reside on the new netbook type computers. In the early days of an "event" internet may not be available for several days. There may be another solution to this scenario, so what can be done to solve this item.

Thanks , John

>computers attached to each node.

John, that's not necessarily true. The computers attached to any node in the mesh are simply behind a firewall. This firewall is just like the one, I hope, is at your home and protecting your home network from outside access and attacks.

Now, when you "access" a computer as a server, it's providing a service - access to a particular program that's listening on an IP port or series of ports. All IP ports on that computer do not need to be opened up to the rest of the network. Several programs can be running on a computer, waiting for clients to connect to program-specifc ports on the network interface should be made available.

For instance, to access files on a Micro$oft file server, your client program will connect to port 873 on the server. This is connected to a program on the file server PC that dishes out the files. To access a mail server on a Linux machine, the client program has to open up port 25 for the SMTP server program on the server.

By default, all ports are blocked by the node or are used by the node itself. Port 80, for instance, is the usual webserver port to access the Apache, IIS, or other webserver program. This is the port is used by the node so that an admin can configure node. (BTW, this looks like it will be changed in the next release of the HSMM-MESH firmware!)

Now, from the mesh, in order to access a server you will need to open a port on the node's firewall and have that port redirected to a particular machine connected to the LAN side of the node. The "slick" feature of this firewall is that firewall openings can be redirected to a different port number.

For instance, say there are multiple PC's on the LAN side of a node, we'll call 'WebNode'. Each of those PC's are running a webserver on port 80, the standard, for various reasons. In order to be able to access all of the webservers, the firewall will need to have a separate port opened for each webserver and redirected to port 80 on each of those servers. So, you tell the node's firewall to open ports 3000, 3001, 3002, and

3003 and forward these ports to port 80 on 172.27.0.10, 0.11, 0.12, and 0.13, respectively. Accessing these from your web browser across the mesh will involve specifying the node and the port number in the URL. So, to get to the webserver on 172.27.0.10 behind WebNode you'd put the following into your browser:

http://WebNode:3000

To get to the webserver on 172.27.0.12 behind WebNode you'd use this:

http://WebNode:3002

Another way to take care of this is to put each webserver on its own node.

>If I understand correctly you have made
>one computer a server for the network and that one serves all the
>others.

Yes, but there can be multiple servers on a mesh if, by protocol, they can co-exist on a network. It would probably be best in case part of the mesh falls off the network.

>Not sure how smart all of us responders are to set something
>like this up.

This is something for more that just responders to setup. Planning for emergency service will be critical. Having the network in place and having responders' equipment setup prior to an emergency will need some networking-knowledgable people.

Keep in mind, too, that HSMM-MESH is not a replacement for the internet. It will provide connectivity although it may or may not be to the internet.

>If the mesh nodes are all within its network could
>something as simple as the program LANChat on each computer work for
>node to node communications or something similar that is small enough to
>reside on the new netbook type computers. In the early days of an
>"event" internet may not be available for several days. There may be
>another solution to this scenario, so what can be done to solve this item.

LANChat may work but I don't enough about it to say. It probably will but the firewall may need a tweaking of its configuration so that LANChat will work across the mesh.

If the internet is not available and certain services are expected from it by responders then some sort of local service would need to be provided. If LANChat won't work on a mesh, as HSMM-MESH implements it, then an alternative is called for -- maybe an XMPP-based chat server and associated clients could be used, for example.

Overall, someone involved is going to need to know something about TCP/IP networking in setting up a network and making ready the gear responders

will be using. You know as well as I that handling emergencies requires planning and training, in the general sense, not just for the particular event. Make no doubts about it -- setup of a mesh network will require some networking expertice and the users may need some training.

You're welcome to contact me directly if I can help you further understand HSMM-MESH networking.

John, that's not necessarily true. The computers attached to any node

in the mesh are simply behind a firewall. This firewall is just like

the one, I hope, is at your home and protecting your home network from

outside access and attacks.

Now, when you "access" a computer as a server, it's providing a service -

access to a particular program that's listening on an IP port or series

of ports. All IP ports on that computer do not need to be opened up to

the rest of the network. Several programs can be running on a computer, waiting for clients to connect to program-specifc ports on the network interface should be made available.

For instance, to access files on a Micro$oft file server, your client program will connect to port 873 on the server. This is connected to a program on the file server PC that dishes out the files. To access a mail server on a Linux machine, the client program has to open up port 25 for the SMTP server program on the server.

By default, all ports are blocked by the node or are used by the node itself. Port 80, for instance, is the usual webserver port to access the Apache, IIS, or other webserver program. This is the port is used by the node so that an admin can configure node. (BTW, this looks like it will be changed in the next release of the HSMM-MESH firmware!)

Now, from the mesh, in order to access a server you will need to open a port on the node's firewall and have that port redirected to a particular machine connected to the LAN side of the node. The "slick" feature of this firewall is that firewall openings can be redirected to a different port number.

For instance, say there are multiple PC's on the LAN side of a node, we'll call 'WebNode'. Each of those PC's are running a webserver on port 80, the standard, for various reasons. In order to be able to access all of the webservers, the firewall will need to have a separate port opened for each webserver and redirected to port 80 on each of those servers.

So, you tell the node's firewall to open ports 3000, 3001, 3002, and 3003 and forward these ports to port 80 on 172.27.0.10, 0.11, 0.12, and 0.13, respectively. Accessing these from your web browser across the mesh will involve specifying the node and the port number in the URL.

So, to get to the webserver on 172.27.0.10 behind WebNode you'd put the following into your browser:

http://WebNode: 3000

To get to the webserver on 172.27.0.12 behind WebNode you'd use this:

http://WebNode: 3002

Another way to take care of this is to put each webserver on its own node.

>If I understand correctly you have made

>one computer a server for the network and that one serves all the

>another solution to this scenario, so what can be done to solve this item.

LANChat may work but I don't enough about it to say. It probably will

but the firewall may need a tweaking of its configuration so that LANChat

will work across the mesh.

If the internet is not available and certain services are expected

from it by responders then some sort of local service would need to be provided. If LANChat won't work on a mesh, as HSMM-MESH implements it, then an alternative is called for -- maybe an XMPP-based chat server and associated clients could be used, for example.

Overall, someone involved is going to need to know something about TCP/IP networking in setting up a network and making ready the gear responders will be using. You know as well as I that handling emergencies requires planning and training, in the general sense, not just for the particular event. Make no doubts about it -- setup of a mesh network will require some networking expertice and the users may need some training.

You're welcome to contact me directly if I can help you further understand HSMM-MESH networking.

If you guys don't mind, I'd like to see the discussion left here. It may
save answering the same questions over and over.

I tool a quick look at LANChat. It's a simple one room chat that doesn't use a server. You might have to open the ports it uses on all nodes rather than just on the one running the server. I was trying to provide a chat server on the mesh, so it wouldn't need an internet based server. LANChat may even work better, in the event of loss of the server node.

Great response. I appreciate you taking the time to explain all this. You hit on one of my concerns and that is having the gear set up, user tested and ready to go. As you say this will take training. Kip has been doing a good job of building a team here.

Thanks, John

<whew> I knew I was hitting a lot of nails on the head but I was a little worried that I was hitting the *right* nails. :-) Hope those explanations were useful to the group.

It all goes back to that old Boy Scouts' motto -- "Always be prepared!" I know Kip experienced his trials and tribulations working with other firmware for WiFi routers especialy having to figure out how to reconfigure the routers in the field. The HSMM-MESH load of OpenWrt is just plain simple, even if the hardware doesn't hold its configuration and you have to reconfigure in the field. The folks in Austin deserve our thanks! And there's more to come!

From: kc5sii
Topic: 1798 Message: 1813

Ok, I've had a little time to cogitate on this. The answer to my question is yes. I have to punch holes in the firewall to get much more than Internet connection sharing. And only HTTP: at that.

I know the focus is on security. Let's sideline those concerns for the time being and concentrate on the primary purpose of most LANS. "Print and file sharing"

I want all the nodes on my mesh to be able to browse to any available resource, primarily Micro$oft hosts, sharing data or peripheries. What do I have to do to make that happen? It doesn't make sense for people to have to figure out how to make resources available via port 80.

If I'm correct, there's a file in the LINUX directory structure that we can edit to make those services something that gets passed (Versus blocked) by the router.

A second, sort of unrelated, question. We've had a few lengthy discussions but haven't come to a conclusion here. Should each Mesh node have it's own LAN Subnet? The only way I've been able to get it to work is to assign a different subnet to each LAN off each Router. Or maybe, via NAT does it matter?

Thanks for your expertise in advance.

Here is the problem.

The router does network address translation. It also gives out a dynamic address when you plug it in.

So the router has an address of say 10.1.1.1. But it hands out addresses 172.27.0.100 to 172.27.0.200. The PC you plug in can have any of those 101 addresses.

When you open a hole in the firewall you open a specific port to forward to a specific IP address and specific port. But in general you do not know what that ip address will be.

One way around it which I have configured, is I set up LAN Port 1 to have it's own address range and it automatically hands out only one address. 172.28.0.2. Now you can open up ports to that address. And can do what you want.

But it also means that the other PC's plugged into the other ports work the old way, but you have one PC per Router that can work pier-to-pier, the other PC's on the router can not.

That is why it is better to have a server. And that is how the Internet works. You connect to the servers.

So, it's not possible for a router to route ALL non-local traffic reguardlsess of port?

Dave, you were OK up until that last sentence. Everything does not
have to accessed through HTTP. Like I wrote earlier, if you want file
sharing just open up port 445 for a Win*ows PC. And that port will be
directed to a single machine on the LAN of the router.

> I know the focus is on security. Let's sideline those concerns for
>the time being and concentrate on the primary purpose of most LANS.
>"Print and file sharing"

Ah ha! <light-bulb>

This is probably the key to your concerns right here: you are wanting
our HSMM-MESH to be a LAN. The way I see it, HSMM-MESH is not really a
LAN technology as we've implemented it. It is not really about sharing
resources (as you are wanting) and more about connectivity between
LANs (like between hospitals, FDs, PDs, EOCs, etc for emergency work)
as well as for communicating (messaging of various sorts like email,
text chats, VOIP, video, etc). Since the little EUREKA moment there,
I coming to believe that HSMM-MESH is more about being a WAN. Yes,
some resource sharing can be useful but not on the scale you would see
on most office LANs.

Putting resources on a mesh, per se, can be a rather daunting task as
you're finding out. It probably wouldn't be effective until we implement
some sort of service discovery protocol and methodology. Hmmmm....

> I want all the nodes on my mesh to be able to browse to any available
>resource, primarily Micro$oft hosts, sharing data or peripheries.
>What do I have to do to make that happen? It doesn't make sense for
>people to have to figure out how to make resources available via port 80.

I'm not trying to be curt but, *for the time being*, I'm coming around to
idea that you'd be better off using another technology.

>A second, sort of unrelated, question. We've had a few lengthy
>discussions but haven't come to a conclusion here. Should each
>Mesh node have it's own LAN Subnet? The only way I've been able to
>get it to work is to assign a different subnet to each LAN off each
>Router. Or maybe, via NAT does it matter?

If by 'get it to work' you mean making all the hosts on the LAN side visible to the mesh... it's probably different subnets on each LAN but... now each node has to be configured differently and that's actually what the HSMM-MESH was trying to get away from.

Good luck!

Ok, We're on the same page now. The mesh network is not designed to provide generic file and print sharing type services.

Has anyone tried a VPN via the Mesh? That might be the solution I'm looking for.

Dave, I wouldn't go quite that far. It's just rather problematic with the HSMM-MESH when you want a bunch of PCs, hooked to the LAN side of one router, to each provide the same services to the rest of the mesh. It's simply not an issue when only one of them does it or each provides a difference service.

> Has anyone tried a VPN via the Mesh? That might be the solution
>I'm looking for.

The mesh is still TCP/IP so VPN will run through it. There will still be issues unless you modify the IP addresses dished out on each node's LAN, so they won't all be the same. One PC addressed as 172.27.0.101 on one node's LAN will conflict with another PC addressed the same on a different node's LAN when the two LANs are connected via VPN.

You can also hand out fixed address based on MAC address so that when a particular computer uses DHCP to get an address, it always gets the same address. Then it doesn't matter what port that computer appears on. It does mean that if the computer that provides the service changes, then you need to change the MAC address. But, you can also use a USB->ethernet adapter, or some other "removable" ethernet interface on the server so that you can move the service between computers by just moving the USB->ethernet adapter to the appropriate computer.

Lots of ways to skin the cat if you just know what cat skinning is and how to do it (carefully).

1822. K5PRK-AP1 In operation

Yahoo group: DAWG-HSMM
Date: 2010-03-09 15:13:23 UTC
From: Kipton Moravec
Topic: 1822 Message: 1822

The first HSMM-MESH node is up and operating at the PARK repeater site on Bethany and US75 in Allen. We believe we got it fixed on Saturday.

We will be testing in the next few weeks to see how far we can reach.

Was there any decision on hosting the video somewhere? Youtube might be a good choice. It could be cut down to segments to meet Youtube length requirements as needed. I can help do all of that if I can have access to the video in its entirety to download and process appropriately I believe.

If someone can provide a copy of the recorded WebInar, either on DVD or possibly via network, I should also be able to convert it to a video stream for Internet access. I know the WebInar recording may too large to many host services, which is why I convert it. I can host it on my streaming server if necessary. Plenty of network bandwidth, just limited file space. I have an audio recording of the Webinar, but video and audio would be better.

Sorry for the late response. I just got out of the hospital.

It is about 180 feet Above Ground Level. We have not done range testing
yet, but I think you should be able to hit it from Murphy if you are
above the trees, or can see it from the ground.

TAPR Spring PSR Journal Call for Papers!

-----Original Message-----
From: Stan Horzepa <stanzepa@...>
To: tapr-announce@...
Sent: Mon, Mar 15, 2010 5:51 pm
Subject: [tapr-announce] Spring PSR: Write For It!

The Spring issue of TAPR's quarterly newsletter, PSR, is in the works. If you would consider writing something for PSR,
the PSR editorial board would seriously consider publishing it. The deadline for the Spring issue is April 15, so you have one month to write something!

The Spring issue appears just before the Dayton Hamvention, so if you want to write something that ties in with the Hamvention, then even better!

Thank-you and 73,

Stan, WA1LOU
PSR Editor

Posted by: "Ford, Steve, WB8IMY" sford@... wb8imy
Date: Mon Mar 15, 2010 12:38 pm ((PDT))

Technical papers are solicited for presentation at the 29th Annual ARRL and TAPR Digital Communications Conference to be held September 24-26, 2010 in Portland, Oregon. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2010. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

1830. FCC Proposes to Eliminate Spread Spectrum APC Requirement, Reduce Spread Spectrum Power Limit; Cleans Up Portions of Part 97

Yahoo group: DAWG-HSMM
Date: 2010-03-19 16:06:45 UTC
From: Mark Thompson
Topic: 1830 Message: 1830

http://www.arrl.org/news/stories/2010/03/18/11396/?nc=1

FCC Proposes to Eliminate Spread Spectrum APC Requirement, Reduce Spread Spectrum Power Limit; Cleans Up Portions of Part 97
In response to a 2006 ARRL Petition http://www.arrl.org/announce/regulatory/SS-Rulemaking-Petition.pdf regarding spread spectrum issues, the FCC released a Notice of Proposed Rule Making(NPRM) on March 16 (WT Docket No 10-62), proposing to amend Part 97 to facilitate the use of spread spectrum communications technologies by eliminating the requirement that amateur stations use automatic power control (APC) to reduce transmitter power when the station transmits a spread spectrum (SS) emission and reducing the maximum transmitter power output when transmitting a SS emission. Through an Order attached to the NPRM, http://hraunfoss.fcc.gov/edocs_public/attachmatch/FCC-10-38A1.pdf Commission also made "certain non-substantive revisions" to the Amateur Service rules.
Notice of Proposed Rule Making
Spread spectrum techniques are methods by which the information signal of a particular bandwidth is intentionally spread in the frequency domain. At any point of bandwidth the SS emission occupies, either the power spectral density of the transmitted signal is reduced to a comparatively low level or the duration of a transmission on any frequency in the frequency segment is very brief. Consequently, stations in the same area can transmit SS signals without causing harmful interference to or experiencing harmful interference from each other or a station transmitting a non-SS signal over the same spectrum segment.
Back in 1985, the FCC authorized Amateur Radio stations to transmit SS emissions with a maximum transmitter power limit of 100 W PEP. To emphasize the experimental nature of spread spectrum as well as some of the potential benefits associated with it, the Commission authorized such transmissions on a secondary basis to other amateur service communications. At that time, the Commission noted that "to reduce the likelihood that SS transmissions from an amateur station could be made for the purpose of obscuring the meaning of a message, the Commission permitted only frequency hopping and direct sequence spreading techniques." Fourteen years later, the FCC eliminated restrictions on spreading techniques "to allow amateur stations greater flexibility and permit them to use the SS techniques used in other communications services." The Commission also required stations transmitting SS communications with a transmitter power greater than 1 W to utilize APC to limit the transmitter power in accordance with a specific formula (permissible power is determined by the use of the ratio, measured at the receiver, of the received energy per user data bit [Eb] to the sum of the received power spectral densities of noise [No] and co-channel interference [Io]; average transmitter power over 1 W shall be automatically adjusted to maintain an Eb/[No + Io] ratio of no more than 23 dB at the intended receiver).
In 2006, the ARRL petitioned the FCC, http://www.arrl.org/announce/regulatory/SS-Rulemaking-Petition.pdf that the APC requirement be eliminated, asserting that the APC provision has proven to be "virtually impossible" as it requires the operators of the transmitting stations to determine the transmitter power received at distant receivers and that this requirement has proven to be " something of a barrier to SS experimentation." The League further contended that the APC

requirement could be eliminated without increasing the risk of harmful interference because:

* The station licensee or control operator of the station transmitting the SS emission would still be obligated under Section 97.313(a) of the Commission's Rules to use the minimum power necessary to conduct communications, and
* Under Section 97.311(b) of the Commission's Rules, SS communications are already secondary to other Amateur Service communications.

In the NPRM, the FCC agreed with the ARRL that the APC requirement "may be unnecessarily impeding Amateur Radio operators in advancing the radio art," but the Commission does not propose to simply eliminate the APC requirement. Noting that the purpose of the APC requirement is to limit interference to other stations, the FCC pointed out that commercial broadband Internet service providers operating in the 900 MHz and 2.4 GHz ISM bands argue that the APC requirement should be maintained in order to prevent interference to other users. They also referred to suggestions maintaining that if the APC requirement is eliminated, the FCC should lower the maximum power limit on amateur stations transmitting SS emissions so that interference is minimized.

Given these concerns, the FCC proposes to eliminate the APC requirement and reduce the maximum transmitter power output amateur stations may use when transmitting SS communications from 100 W to a peak of 10 W.

"We believe that this approach is consistent with both the ARRL's request that we eliminate a requirement that may be impossible to implement and the intent of the APC requirement to limit interference to other stations," the FCC stated in the NPRM. "We also believe that the proposed rule change would (1) encourage individuals who can contribute to the advancement of the radio art to more fully utilize SS technologies in experimentation, (2) balance the interests of all users in mixed-mode and mixed-service frequency bands until sharing protocols are sufficiently developed to avoid interference and (3) promote more efficient use of the radio spectrum currently allocated to the Amateur Service." The Commission is seeking comments on this proposal.

Order

In the Order, the FCC made amendments "to correct the Amateur Service rules or conform them to prior Commission decisions." These revisions will take effect once they are published in the Federal Register.

The FCC noted that when they authorized Novice class and Technician Plus class operators to transmit in certain portions of the 80, 40, 15 and 10 meter bands in 2006, they intended to limit those stations' power in those bands to 200 W PEP, "but the implementing amendment to Section 97.313(c) inadvertently applied that power limitation to all frequencies authorized to Novice and Technician Class licensees. We therefore correct Section 97.313(c) to clarify that the limitation applies only in those bands."

The Commission also revised Sections 97.301 and 97.303 related to the 40 and 60 meter and the 70 cm and 9 cm bands to conform to the Table of Frequency Allocations (Table), and to references within the relevant sections of the rules. They also revised the frequency sharing requirements in Section 97.303 "to limit the summary to those frequency bands that are allocated to the Amateur Service on a secondary basis, and to present the requirements more clearly."

In addition, the FCC moved transmitter power limit information from Section 97.303(s) to Section 97.313, the section concerning transmitter power standards. Section 97.103(c) was amended to delete the cross-reference to Section 0.314(x) that was removed in 1999. They also removed the entry "1260-1270 MHz" from Section 97.207(c) that lists the frequency bands authorized to amateur space stations "because footnote 5.282 to the Table limits the use of that segment to Earth station transmissions."

How to Make Comments on the NPRM

Pursuant to Sections 1.415 and 1.419 of the Commission's Rules, interested parties may file comments on the NPRM on or before 30 days after date of publication in the Federal Registerand reply comments on or before 45 days after date of publication in the Federal Register. Based on previous experience, the ARRL expects publication of the NPRM and Order in theFederal Register sometime in early spring. Instructions on how to file comments on the NPRM only are listed on pages 6-7 in the NPRMhttp://hraunfoss.fcc.gov/edocs_public/attachmatch/FCC-10-38A1.pdf.

From: Steve
Topic: 1831 Message: 1831

I haven't done a ton of testing of the XR9. But the preliminary report is about a mile NLOS, using a 5 MHz channel, with a base station at 35 feet into a 6-dBd omni antenna and a magnet-mounted antenna on the car. Usable connectivity is a bit less than that.

Not exactly impressive, but I wanted to share that. I'm sure things will be more successful when I get around to sticking a yagi up in the air at a few locations.

For comparison:

With the AeroComm I reported solid mobile coverage for about 5 miles. And was had non-solid for out to about 7 miles.

To be expected as the data rate is substantially better with the XR9... so there is your trade off.

If you are looking for a NLOS solution, may I direct your attention to something for the 70cm band:

http://www.xagyl.com/store/product.php?productid=16450&cat=251&page=1

This was recently brought to my attention, and is Very Interesting. I am hoping to get in touch with XAGYL in the next few days to see what else I can learn.

XAGYL Communications, appears to be a Canadian Distributor of Ultra High-Speed, Long Range Wireless equipment. It looks like about a year ago they partnered with Doodle Labs, a privately held manufacturing company with headquarters in Singapore to design and manufacture a new line of long range Wireless Data Transceiver devices.

1833. WRT54GL mobile power

Yahoo group: DAWG-HSMM
Date: 2010-04-14 16:26:27 UTC
From: Todd Caldwell
Topic: 1831 Message: 1833

Hello all,

I'm in the process of installing my ham gear in a new (to me) vehicle. I plan to include a WRT54GL in the equipment list, and was wondering if anyone here has experience running one directly from a vehicle 12 VDC power system ? Mine is one that uses 12 VDC power, but I'm a bit concerned about the variations in voltage in an automotive power situation.

Just wondering if this has been tried and if you added any filtering or regulation between the vehicle and the router.

Thanks,

Todd Caldwell

Not a problem. It draws about 400 mA and has a switching power supply.
It will work from 7.5V to 18V.

On long >200 feet passive power over Ethernet runs I had to add an
external 10000 MFD capacitor, but you will not have that problem.

From: kb9mwr
Topic: 1831 Message: 1836

I learned it's Atheros based with a frequency converter.

They also working on custom drivers that would allow better frequency management.

They are willing to work with hams. As until the drivers are developed they offered to custom program the center frequencies, but the channels will be 5MHz apart.

The initial goal is to have them centered at 422.5MHz and up at 5MHz intervals up to 447.5MHz.

With modified madwifi drivers, the sales guy says they would have better granularity, and we could pick the center frequency with 1MHz increments.

So this could easily fit into unused ATV channels on 70cm

Also worth mentioning is FCC-ID: SWX-M900
Ubiquiti's 900 MHz TDMA bullet like radio

Hi Josh,

Eventually I hope to use the router for HSMM-MESH connectivity. However, we don't have much in the way of infrastructure here in Mesquite yet. So until then I plan to use the router to connect a couple of Zonet IP Cameras to the wireless LAN here at the house. A buddy and I travel to a number of local sci-fi conventions too. I hope to be able to use those same cameras to keep an eye on my truck from the hotel rooms while at the conventions.

A fellow ham also travels to some of the conventions, and there's been talk of setting up a mobile wireless video conference for the drives too.

So basically I'm presently doing it for practice and for geek points. :)

Gordon,

I hope to be able to configure DD-WRT or Open-WRT as an access point and have it connect to the wireless router in the house. Just plain wifi there, no HSMM. The cameras can upload to a remote server with no additional help as far as I can tell. I have an offer from a ham buddy/networking guru to set me up with some server space on one of his servers, so I'll probably use that as a destination off site. The camera software can also record locally onto my hard drive. They have a motion sensing capability that I intend to use while they're in the security role.

Todd

That is excellent news. It would be REALLY NICE if they could retrofit an amplifier keying circuit into the design so that it would be easy to operate a small external amplifier. Same thing goes for the XR3 product, which would be great for hams on the little-used 9 cm band.

Call for Papers--2010 ARRL/TAPR Digital Communications Conference
Posted by: "Ford, Steve, WB8IMY" sford@... wb8imy
Date: Thu Apr 15, 2010 11:12 am ((PDT))

Technical papers are solicited for presentation at the 29th Annual ARRL and TAPR Digital Communications Conference to be held September 24-26, 2010 near Portland, Oregon. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2010. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

73 . . . Steve, WB8IMY

1843. Securing my HSMM router

Yahoo group: DAWG-HSMM
Date: 2010-04-18 22:10:00 UTC
From: yajoo_1
Topic: 1843 Message: 1843

Several of us here in Nacogdoches are starting to experiment with HSMM-MESH. I have flashed my Linksys WRT54GL version 1.1 with the hsmm-mesh-0.3.2-wrt54g.bin and then with the hsmm-mesh-0.3.2-brcm.trx file. It worked and the router is working, I can log in and have looked at the various option for MESH Node, Mesh Access Point, Router etc. The settings in the configuration pages are pretty sparse and many are defaulted and unchangable. I can see the router wirelessly with a laptop and an iPhone

I do not see how to secure the router except the Administration password.
How can I prevent war-drivers and curious passers-by from connecting to my router?

Thanks,

KD5FEE

> I do not see how to secure the router except the Administration password.

There's not much you can do. The FCC will expressly allow you to use WEP, IF the password has been previously mailed to the FCC and placed on record so it is "publicly" available and thus not "obscured" from the public. That issue was resolved pre-Katrina with them, confirm it with the ARRL and FCC if you need to.

You should also be able to hide the SSID and to restrict the MAC addresses that are allowed to access it. Hiding the SSID won't stop hackers; WEP won't slow them down more than 5 minutes; and MAC addresses can be impersonated. And, will mean legitimate users have to pre-register with you in order to get in.

That's about it, if you are using it for ham radio.

If the use is totally non-ham, then you move to WPA2 authentication, which is reasonably secure. You might ask the FCC if they'd allow you to use that instead of WEP, which would certainly be logical. I just haven't heard any formal opinion from them on that yet.

Red et al,

If you can mail them a WEP password, then there is no reason why you
couldn't mail them a WPA/TKIP passphrase along with the SSID.

Thanks & 73,

Gordon Beattie, W2TTT

WPA/TKIP will not work with HSMM-MESH. Only WEP works with an Ad-hoc network.

And you only have to have the password in your logbook. You do not have to pre-mail it to them.

The next version of HSMM-MESH software will make it a little (not a lot) harder for someone to break into it.

1848. Re: Securing my HSMM router

Yahoo group: DAWG-HSMM
Date: 2010-04-20 01:44:17 UTC
From: yajoo_1
Topic: 1843 Message: 1848

Thank you for your answers. I cannot find anywhere in the router configuration pages, using the hsmm-mess-032 flash to start a WEP or MAC filters or anything like that. When I log on the router I get a Status page, a Basic Setup page, a Port Forwarding and Static DHCP page, and an Administration page, none of those seem to afford me any particular method of security.

Did I miss something in the instructions? There are virtually no configurable settings on any of the setup/configuration pages I can find on the router.

Thanks in advance,

KD5FEE

Because it's not there. Encryption has to be done manually. Ssh into
your node as root and 'cd /etc/config.mesh'. At the end of the file
'wireless' at these lines, indented appropriately:

```
option encryption wep
option key 0123456789ABCDEF0123456789
```

Replace the key above with your own 26-hexdigit code.

Save the file, run 'node-setup mesh', and reboot.

It's that way to keep it simple. And it takes time to build up
webpages/perl scripts for everything but if everything's configurable
sooner or later nodes stop talking to each other. You'd be surprised!
Talk to the Kipster about having to reconfigure nodes in a hurry.

What more do you NEED to configure that's not in the Setup pages? :-)

1851. Mounting Bracket for WRT54G

Yahoo group: DAWG-HSMM
Date: 2010-04-26 23:24:32 UTC
From: k8cop
Topic: 1851 Message: 1851

I am trying to locate a mounting bracket for a 54G unit. Unable to find out where to buy one at. It snaps onto the bottom of the router. The plastic mounting plate mounts on the wall.

Thanks,

Jim, K8COP
Twin Lake, MI.

I have seen them but I do not know where they came from.

We tend to use Velcro. It makes it really easy to put in the box and
remove or adjust.

Subject: [tapr-announce] TAPR at the Dayton Hamvention (May 15-16, 2010)

Dayton Hamvention is the biggest gathering of ham radio operators on the planet and as usual, TAPR has a full slate on tap for the Hamvention weekend (May 14-16, 2010).

TAPR Booths:

Booths 455 through 458 in the Ball Arena of the Hara complex is where TAPR presents the latest advances in the state of the ham radio arts.

TAPR Digital Forum:

TAPR Digital Forum runs from 9:15 to 11:15 AM on Friday in Room 1 of the Hara Arena with the following schedule of presentations, moderated by Mark Thompson, WB9QZB:

9:15 – TAPR Update by Steve Bible, N7HPR, and Scotty Cowling, WA2DFI

9:30 – WL2K Network and its RF Portals by Rick Muething, KN6KB, and Vic Poor, W5SSM

10:00 – TAPR Project Design for Manufacturing, by Scotty Cowling, WA2DFI

10:30 – Putting HPSDR on the Internet, by John Melton, G0ORX/N6LYT

11:00 – Wrap-up

TAPR-AMSAT Banquet:

Friday evening, TAPR joins AMSAT for their fourth annual joint banquet at the Kohler Presidental Banquet Center, Kettering, OH (just south of Dayton). Dr. Bob McGwier, N4HY, will be the after dinner speaker.

Doors open at 6:30 PM and a cash bar will be available. A buffet dinner begins at 7:15 and includes Salmon with Newberg Sauce, Marinated Roasted Garlic Rosemary Chicken Breast in Lemon Butter Sauce, Marinated Pork Loin, Scalloped Potatoes with Parsley, Normandy Blend Green Beans, Fresh Fruit, Green Salad, Pie, Iced Tea, Hot Tea and Coffee.

Make reservations for the banquet online at the AMSAT Store <http://www.amsat-na.com/store/item.php?id=100158> or contact Martha at the AMSAT office from 10 AM to 6 PM EST/EDT at 301-589-6062 or toll free at 888-322-6728. You can pick up your reserved tickets at

the AMSAT booth on Friday or at the door.

Topic: 1858 Message: 1859

We usually put the WRT54G into an enclosure and run a 12" - 18" "pig tail" cable from the back of the router, to a female bulkhead N connector mounted to the enclosure.

From there we often use LMR-400 with N connectors to get to the antenna. The pig tail cable has the needed connectors. I believe they use LMR 100 for these short cables. (See fab-corp.com mentioned below)

The bulkhead N connector mounted to the enclosure provides a solid mount that can deal with the stiff LMR-400 jumpers to the antennas.

The "pig tail" adapter cables are available from several sources. I get mine from www.fab-corp.com.

I usually make my own pig tails. Most of the ones I have bought were made from LMR-195. Some time back I picked up 50 feet of LMR-195 for that purpose.

It has the same diameters specs as RG-58. So in that regard you can use normal connectors.

Sounds good. The small diameter coax is a challenge to work with,
and requires, yet another collection of connectors to keep in stock.

Topic: 1862 Message: 1862

I would like opinions on this. We are trying to find and negotiate space on top of a building in our area and another HAM who already has a repeater at one particular site was asked to help. He presented the following to the building manager and then declined to help us negotiate access.
"HSMM-MESH may be near the frequency that their wireless networks operate, at that point the building manager asked me not to do anything that might even remotely be blamed for interference"
So, how do we approach this concern with potential sites?
Thanks, Tim KD5KTB

Tim,

Without knowing anything else about the situation, my first reaction is that the ham in question who already has a repeater setup on the site doesn't want anyone messing up his "honey hole".

While what he said was absolutely the truth, I can't help but believe that the manner in which it was stated was such that it would lead a supposedly non-technical building manager to believe that this new-fangled thing would not be a passive resident on the roof as is his current repeater.

For what it's worth, that building manager is tainted... by misleading info... and he's made up his mind. He's known this other guy, who assumedly has a track record for not causing trouble. He believes the other ham due to his past experiences and is not inclined to give you (the "new guy") a break because the guy he's trusted has said that you *might* be a troublemaker.

Write it off and find another building.

If you want to see just how petty and childish repeater owners/trustees can act, just look at some of the politics and foolishness that takes place in the Texas VHF-FM Society. 'nuff said. :)

I may be a little naive here but I assume you are still talking about RF in the WIFI band and relatively low power levels?

If that is the case wouldn't part of the argument be that the existing building is probably already full of WIFI AP's and that one more is really not going to interfere with the existing services which I assume are probably WIreless Mobile Carriers.

Further, if there was going to be interference I would expect that the HAM repeater belching out tens of Watts of power may be a better candidate for overloading RX front ends than a WIFI AP?

maybe I am confused.....I have not been following these threads that closely lately :)

I'm relatively new to HSMM, so I'm going to apologize in advance for any ignorance....

I'm assuming that you were looking to run in the 2.4 GHz spectrum? If so how much power? The building owner is probably worried about you clobbering the Wireless LAN's in building on 2.4GHz. Being a WLAN Engineer I know I would be too.

It's probably not any more "sinister" than that. I think some folks are reading way too much into this.

How much power do folks typically run on 2.4 GHz?

Also the ERP and radiation pattern from the top of the building should be understood and explained, not to mention the design and operating characteristics of 802.11. I would expect wireless routers inside and around the building pose a greater impact to each other, than one on top of the building. I suspect microwave ovens and 2.4GHz phones inside the building cause more interference. You probably won't convince that building manager or other ham of that. But might be good to have that information in presentations for other potential sites to counter the interference question if raised.

Hi Tim,
With HSMM we can add power, but choose not to for various reasons. Primarily because we do not need to. So, all we use is a standard WRT54G wireless router just like they probably have inside the building in several locations. We do not add any power to the device. I think the part 15 wifi power is 1.0w. Max EIRP is up to 4w. Point to point is maybe 6w. But for what we want to do, we would be at the lower power. We put a high db gain omni and or directional antenna on it.

I think its typically around 30mw or so... not a whole lot.

Under Part 97, we're allowed to use much more power, but most people would rather focus on the antenna system rather than microwave amps, cost and power consumption being two fairly good considerations.

I guess I'd argue more than anything else that the signal from an HSMM-MESH node put up on the roof wouldn't really be that strong inside the building, which would be directly below it, based upon the kind of antenna you'd be using.

Directional antennas would send the vast majority of the RF in a line-of-sight somewhere else, not where the building's WiFi users are located. Likewise, a omni-directional antenna, such as a stacked J-Pole, would have a fairly low radiation pattern downwards, essentially an RF "hole", towards the building's users below it.

In the absolute worse case scenario, however, it's certainly no worse than the folks in the building next door (well, everyone in the neighborhood) who are also operating WiFi systems of their own.

Presuming that the building does not have any WiFi related antennas
on their roof and said roof is more than just wood... My response to
potential sites:

Given our antenna pattern and low power levels (<100-mW with a 54g)
the concrete and/or steel in the roof's construction will block or
absorb most, if not all, incidental radiation from the antenna.
Because of the complexities of WiFi signals any interference, if
it could be legitimately detected, would be difficult to trace and
would more than likely be coming from adjacent buildings through
NON-SHIELDED openings such as glass windows.

From: Glenn Currie
Topic: 1862 Message: 1872

I am one of the original HSMM-MESH developers.

Several of us have been active in the field for about 8 years, so have had time to read about the theory, look at the topo maps, try out the simulation software and then see how stuff really performs in the field.

Long ago, I had one of the early ARPANET accounts and started reading academic papers on robotics, and communications systems. I have been reading the papers for 30 years now, so even a slow learner can pick up on trends if he blasts through 20 to 30 papers a week. Keeping up with the papers is what caused me to push for this auto linking mesh technology for our broadband radios. Mesh systems have been discussed for over a decade and are now being widely deployed in the field. They are used by the military and commercial systems for good reason and hams have similar needs for robust, easy to set up and configure emergency radios.

Most of the comments recently posted match closely my experience in the field. Here is a bit of what I have seen.

HSMM-MESH is very flexible so you could set it up almost any where, but in say on a hospital roof, what we find is that the building Wi-Fi is designed to cover the inside of the building and our mesh node is designed to cover outside the building and with basic knowledge of antenna patterns, you can put your signal where you want. It is good to verify a pattern with test equipment, but if you have installed a dozen of the same type antenna, you get pretty good at knowing what to expect from the pattern.

So the comment that interference between the indoor hospital Wi-Fi and the mesh node outside is usually minimal, is borne out in what I have seen.

We routinely do 10 mile hops using a 35 - 50 mw WRT54G based mesh node. This is a point to point to point link using horizontal polarization to take advantage of the fact that much of the Part-15 devices use roughly vertical polarization. So we can be surrounded by APs at each end of a 10 mile link and with highly directional antennas, we get very good signal strength, relative to devices out of the pattern of the antenna.

We have worked with amps to try them out, but with a microwave signal we have found you either have a good path or not. If you do not have a good path, you need to get a good path or have an amp powerful enough to burn a hole in any obstruction, in order to have a good path. Amps can be of some help in marginal situations in an emergency, but you also amplify the noise with the signal so if you have marginal signal to noise ratio, the amp is not going to help much. The trick is you can use low power if you get a good path

and thus put your signal where you want it. With an amp, you can easily just make a mess of things and still not get a good link.

One place where an amp works well is if you cannot get the radio near the antenna. Commercial microwave guys with lots of money often still put the radio right behind the antenna because the feed line loss is so bad at microwave frequencies. These guys could buy the best hard line available but still often choose to put the radio right by the antenna to do side step feed line loss.

BUT if you find your self in a situation, like we did, where there is an existing antenna up at 300 feet on a tower, and the feed line in the radio shack is not connected to anything, you work with what you have. Plug in a mesh node and see how it gets out.

Inside the feed line you do have loss but you
are in a highly shielded environment so you have little noise, so an amp can work well. It did for us in this case. The amps used are Bi-directional amps so they amplify the received signal as well. So with both the transmit and receive signal amplified the feed line loss is largely overcome with an amp. So here a 500mw amp worked like a champ.

At 300 feet up I was able to link to the node from 5 miles away using a patch antenna on the top of my car. I had to get to a place where I could see the tower and antenna for it to work. Move over a few feet ... and nothing.

In another field experiment we set up two WRT54G based HSMM-MESH nodes on tripods with the radios in a weather proof enclosures attached to the tripod mounted mast, just below an 11dB omni directional antenna. The antenna was at about 5' above the ground. We placed another like system 7 miles away and with about 50mw we linked over the 7 mile path.

Our test range is a section of highway 290 between Austin and Elgin, TX. it is straight as an arrow, and the topo maps showed us were there were some slight hills on each end of the "test range" so we had basic line of sight, but not even a completely clear Fresnel zone.

So we use this a a type of rule of thumb for a best case situation. We had no obstructions, the area was pretty quiet with regards to RF and conditions in general were good. So if you have near optimum conditions, we have done links of 7 miles on 50mw with 11dB omni directional (omnis not directional) antennas.

As you move into an area with path obstructions and lots of RF, range will degrade, but at least there is a known and tested best case example to keep in mind.

Now on to the clever design of the Wi-Fi signals. I read one paper where some grad students put Wi-Fi gear near microwave ovens to test noise immunity. The spread spectrum signaling technique is specifically designed for great noise immunity. After much testing the conclusion was that they could offer no suggestions for the improvement of the spread spectrum system used by 802.11b/g Wi-Fi devices.

When near enough a microwave oven the signal can be blocked. But if you get a few feet away from the microwave oven, data starts to flow. There are errors and re-sends but the little radios have multiple ways to make nothing short of a heroic effort to get your data through. By the time you get 30 feet away, the microwave oven has very limited effect on the throughput of cheap consumer Wi-Fi gear.

One reason the gear is so popular is that you can do a sloppy installation, leave the AP on the floor with the antennas folded up and the system will still work reasonably well for the space inside a normal house. If the radios were finicky, then people would have problems with them and tell everyone they are junk and not to buy them. The 802.11b/g units sell by the millions to people that know nothing of radio theory.

In doing surveys using Kismet and NetStumbler, I have surveyed the University of Texas area in Austin. This is another good test site. This one is "worst case" With all the student housing on the west side of the U.T. campus, it is easy to find an apartment complex with 12 routers on the same, "out of the box" channel setting and no encryption turned on etc. Literally right out of the box and plugged in. While there are many packet collisions and re-sends, most users never notice it as the effective throughput remains quite good in most instances. The radio link typically remains much faster than the cable data rate from the ISP feeding the radio. So a dozen AP within a few feet of each other on the same channel regularly pass data well enough that the users never notice.

There can be problems, don't get me wrong but you really need to tinker with these systems to have an appreciation for how robust they are. I found the robustness and data rates counter intuitive in these bad situations.

I regularly run 30 - 40 mesh nodes and a mix of plain Wi-Fi gear in my house. At times I have 25 units literally stacked one on top another with their plastic antennas touching. There can be problems but am impressed with how well these systems cope with like devices on the same channel.

So from what I expected, I have over the years come to expect much less harmful interference with these 802.11a/b/g radios. You could have a problem but I think you would have to work real hard to ever cause a problem with a well laid out hospital Wi-Fi system. With free packet logging software like WireShark, you can see some interaction but most users would never notice.

(I have found the 802.11a radios be be a bit more finicky about antenna placement.)

So potential interference between a mesh node servicing sites outside the building seldom, in my experience cause any problems with the WI-Fi systems the hospitals have for use inside the building. Carefully choose your antennas with the pattern that will put your signal where you want it and we have not really had any interference problems at any of our sites.

Note that your gain omnis have a sort of donut pattern. With the antenna on top of the building, little of your signal is going directly down, and an you have the roof that usually has metal in it, between you and the radios in the building.

Go to a highly directional antenna, and you put almost no signal into the building holding the mast, unless you aim the antenna straight into the building. So with a high gain dish or yaggi, your chances of creating harmful interference with the Wi-Fi system in the building approaches zero ad you are aiming your signal away from the building.

You can use the "Wi-Fi scan" feature of the HSMM-MESH firmware to see what Wi-Fi signals the mesh node sees. You can also link to any live mesh node in your network and ask it to show you what Wi-Fi signals it sees. So you can collect data on the Wi-Fi environment for each node in your network.

It is good to check what each node can see on a regular basis as the Wi-Fi landscape can change rapidly.

Our longest link with the WRT54G units without amplifiers has been just under 16 mile. That was the limit of local sites we could easily access that provided a line of sight path.

All of the remarks above are for a WRT54G that has no real changes other than loading HSMM-MESH firmware and adding a good antennas (except for the parts where I was explicitly talking about amps) so as stated by others, we find limited use for amps for HSMM work.

There is a long standing type of microwave work where hams use high power and send CW and see how far they can get out, often from mobile rigs. The NTMS and Roadrunner Microwave Group are full of hams that do this kind of microwave work. Their experience is very valuable and it is most helpful to talk with these guys about their field work and antennas. But a high power narrow band brief contact for a QSO, is somewhat different task that than pushing a 22MHz broadband signal out and maintaining signal integrity for long periods of time. They are related but also have their distinct differences.

Most of the narrow band microwave hams use a lot of power and for the work they are doing, it is a must.

For HSMM work where we may leave a transmitter on for hours, days or months at a time, you need to decide what area you wish to cover reliably and put your signal there. Keep in mind the 7 mile links we have done with no amps and only 11dB omni antennas and consider if you need an amp or not. Even commercial point to point microwave networks feed more than 10 watts into the antenna and it is much more common to use 1 to 4 watts max into the antenna.

A good path is key. One "well placed" tree in your path will eat your signal. A number of hams and certainly the commercial microwave guys have been doing microwave work for decades and they spend the money to get good sites. Even for people with a big budget the physics rules. They spend the money for a better site, not a bigger amp.

Your conditions may vary and you have to do what the physics dictates for your particular link, but think twice before slapping on an amp, before you even try the system. The RF path calculators are helpful. They will get you in the ball park if you use them correctly and model your height, feed line loss, antenna gain and path. If the software shows a bad path, an amp is not likely to do you much good. Some of the better software allows you to feed in your power level. Go ahead and plug in a big number and see what the path analysis looks like. Amps can be useful when used carefully, but they are far from a cure all to make a link.

The work horse VHF and UHF radios have their own propagation characteristics. They tend to be much more forgiving than propagation for microwave signals. The trade off for bothering with the LOS path requirements for microwave is that you can get massive bandwidth. With a good link, you can pass the entire ARRL hand book in 30 - 40 seconds. If you have a good path, you can open a real fat data pipe.

This is just some of my experience, I encourage you to get out and try some of these interesting little radios. They are relatively inexpensive and can be a lot of fun. I am always interested in any field experience people can share. There is always more to learn and yet another installation or path challenge to study.

"Write it off and find another building" Yes, already going down that path, but I am looking for information on how others may have approached building managers and building IT managers who will have these same concerns and questions. I agree, in this case, we were not even allowed to address any concerns. So, I plan to not allow that to occur again. How have others addressed these interference concerns?

Thanks,Tim

Along these lines, let me relate something from our past experience. This will not answer the original question, but is a cautionary tale.

On our 17 story company building, we were allowed to put radios on the roof. Now, we have experience putting up multi-mile links, but we were not able to make the .5 mile path work from our roof to a shorter nearby building. The problem appeared to be on the other end. Our company building was full of 2.4 & 5.8 GHz APs, and they reduced the S/N at the far end of the path low enough that the path could not work. We tried up to 43 dB of total antenna gain, but nothing worked.

We're pretty sure about this. When we started experimenting, there were no APs in the building, and we were able to use the roof to make up to 20mi links. Once the APs went in (5 to 7 per floor), no such luck.

This was with the WRT54Gs, which did not have a great receive threshold.

From: Glenn Currie
Topic: 1862 Message: 1874

All very good info. Thanks for relating it.

When you mentioned the tall buildings, it reminded me of an even more
off the original topic, but still possibly of interest bit of info.

The weather in Texas gets so hot that most of the glass covered tall
buildings use a type of reflector glass made with powdered metal in them
to help keep some of the suns radiation out. I personally knew of an older
building where they added a stick on reflective film on the inside of the
windows to help keep the cooling bills down. They saved over $16,000.00 a year
in cooling costs.

The key point I was getting to, is these windows tend to block RF to some extent.
If you ever work inside or outside a building with these type windows you need to
remember the metal in the glass. In some cases it can act to help contain the
RF of now widely used Part-15 APs to inside the building. But blockage is not 100%.

More to my point, I have done portable work where I tried to transmit a signal
out an upper floor window to a mesh node outside the building, and of course the
mesh node outside was trying to get through the glass to me. In some cases there
seemed to be minimal blockage but in some cases the RF blockage was significant.

We do not usually run enough power on our HSMM systems to be of danger, still we
encourage all users to always assume that significant power is being radiated and
just make it a habit to not walk in front of a dish antenna, or in the case of the
reflective glass, don't crank up the power, trying to make a link out a window that
has glass in it acting like a RF mirror.

"Its not working, crank it up. It is still not working, crank it up. Do you feel warm?"
;-)

If you work with the HSMM-MESH stuff long enough, your will probably find a time
when you can take a throw box and a small yaggi antenna up in a tall building and
try making contact with another node somewhere outside the building - and you will
be faced with a potentially highly RF reflective window.

A "throw box" is a term used by the DieselNet researchers at UMass for
a radio, battery and everything in a small plastic box. We use the plastic ammo boxes
as the factory WRT54G antennas fold up and work through the plastic case just fine
for short range work. I also aim a patch antenna out one end of the throw box,
through the plastic - works like a champ.

Anyway, I did window shots from several tall buildings in Austin to a target node
that was about the same distance from all the buildings my link was in, and the
signal strength varried tremendously. Basically for the one really old building with
no reflector glass the signal strength was the highest, and in the newest building,
with reflector glass, the link signal was the lowest.

Users often do not take care in how they place an AP so some of the manufacturers really kicked up the transmit power level and added multiple antennas.

In my microwave RF filled house, my laptop always wants to link first with my neighbors AP, instead of mine because the neighbors AP signal strenth is higher in my house than my any of the 2.4 GHz gear I have, unless I turn on one of my 1 watt amps.

I sometimes joke that my neighbor is burning my shadow into the paint on my bedroom wall nearest his AP and he may be steralizing somthing in his own house. The point is that with all the RF toys I have on in the house, his AP has a higher relative signal strength in my house than my local gear.

(the neighbor does not have powdered metal reflectorized windows.)

Such reflector windows can be used as an RF reflector as I have linked mesh nodes by bouncing a signal off a shiny building to another, around the corner.

Shooting straight up at the bottom of a metal curved belly water tower, I have linked to AD5OO about a mile away. We had no line of sight, but the bank shot off the belly of the water tower worked.

Anyway, as the RF
noise floor goes up, a number of the Part-15 APs have a much stronger signal than most of the older gear. So the Wi-Fi surveys are good to do often. Somebody buys a new AP to replace an old one an you could have an intference problem you did not have the day before.

Please share any field experince you have. There is a great deal of some types of Wi-Fi related info on the Internet, but not that much related to the type work were are getting into with HSMM. One area where there is very little info is on any studies of signal strentgh over extended periods of time. Seems things move fast with much of the Internet crowd. Lots of quick info about some project, but almost nothing of how it is going a year later.

We will eventually get some write ups on some field work posted on our web page hsmm-mesh.org, but all the developers keep real busy and new material is getting posted slowly.

Along these lines, let me relate something from our past experience. This

will not answer the original question, but is a cautionary tale.

On our 17 story company building, we were allowed to put radios on the

roof. Now, we have experience putting up multi-mile links, but we were not

able to make the .5 mile path work from our roof to a shorter nearby building. The problem appeared to be on the other end. Our company building was full of 2.4 & 5.8 GHz APs, and they reduced the S/N at the far end of the path low enough that the path could not work. We tried up to 43 dB of total antenna gain, but nothing worked.

We're pretty sure about this. When we started experimenting, there were no APs in the building, and we were able to use the roof to make up to 20mi links. Once the APs went in (5 to 7 per floor), no such luck.

This was with the WRT54Gs, which did not have a great receive threshold.

1875. Re: [ntms-hsmm] Re: HSMM-MESH Host tips

Yahoo group: DAWG-HSMM
Date: 2010-05-13 03:51:12 UTC
From: Glenn Currie
Topic: 1862 Message: 1875

A few other bits of info regarding working with a host for a HSMM-MESH node:

We have shared a bit of info regarding the mesh node interfering with a Wi-Fi system in a host building. That is on the RF side of things.

Other issues can be if you plan to try to ask for an Internet connection for the node. You need to plan this well as there are many implications - maybe for another post, so I can try to stay on topic.

We run UV resistant, shielded CAT-5 type cable up to our mesh nodes and use POE to run power up the same cable. Most new buildings are pre-wired for computers and have CAT-5 type wire run on each floor and one or more equipment closets on each floor so they can use a patch panel to make a link anywhere on a floor of even floor to floor to any room, without having to pull new wire.

When you talk about getting from the roof to a radio shack or an equipment room for your POE injector and or a server, the building facilities people may want to use their pre wired computer cables - that is what they are for. Try to avoid this. Run your own cable so you are completely seperate from any of the buildings network cables.

We always try to run our "feed line" down the same paths as any coax we might have for other radios, and do all our lightning protection ourselves and avoid being connected to the buildings computer network in any way. If we wish to provide an Internet link, we go through an optical network coupler from the ISP and then send the signal up from the POE injection point in an equipment room or the radio shack.

It can be tremendously helpful to not have your cable runs have anything to do with the buildings pre-wired network cables. Be physically separate and only connect, if allowed to, via an optical link to isolate the connection to avoid allowing lightning into your host's network.

In many meetings, you may find it helpful to
fight FUD by repeating the mantra "we are not physically connected to any of your network cables. We are not physically...." There have been times where people kept going on and on how we were going to burn up the buildings network cables... If you can keep your wires physically separate, then it is simple enough that even a non technical person can understand. We are not physically connected to your network. This may sound silly but this sort of thing comes up often when talking to a potential host, having separate cable runs is the only thing that will save the day.

If your host will not provide you an Internet connections, and many of ours will not, for security reasons, they can also complain about your network cables being a problem. A real IT guy will be able to understand that your cable is completely separate from his network wiring in the building but we have had problems with less well informed and less technically competent people going NUTS when they see you are running network cable. The black UV outdoor shielded CAT-5 type wire we use is gel filled

as well so it can be used for direct burial if need be. But the biggest help is that it has a black jacket and is about the same diameter as RG-8 coax. So at a glance it looks like RG-8. Do not seek to dispel this misconception. ;-)

So if we ALWAYS refer to it as FEED LINE and not CAT-5 or network cable, it saves an unbelievable amount of trouble. So remember - it is RADIO FEED LINE!

Use technical incompetence to your advantage.

So the two tips - run your FEED LINE through the paths that would be used for coax cable for radio antenna feed lines, and remember it is FEED LINE, not network cable.

Hi Tim,

With HSMM we can add power, but choose not to for various reasons. Primarily because we do not need to. So, all we use is a standard WRT54G wireless router just like they probably have inside the building in several locations. We do not add any power to the device. I think the part 15 wifi power is 1.0w. Max EIRP is up to 4w. Point to point is maybe 6w. But for what we want to do, we would be at the lower power. We put a high db gain omni and or directional antenna on it.

How much power do folks typically run on 2.4 GHz?

About as much as my microwave oven puts out!
Sometimes between that or the steam from a pot of boiling water is enough to knockdown the WiFi in my house (off the shelf WiFi to a laptop computer about 40 feet through the house).

Tim-
There are a lot of politics and buddy games involved with many ham repeater sites, so it may not pay to go any further. But you might try to speak to the building manager face to face, when he's not busy, and remind him that "interference" doesn't have to be a great mystery.
When Edison was trying to sell folks on electricity there was great fear that AC could somehow leak out of the outlets and kill everyone, all by itself. The folks selling DC were behind the rumors, of course.
That's what happens when folks just don't understand things.

So you conveniently bring a laptop loaded with inSSIDer (freeware for Windows) or similar software, that can sniff out and display all the WiFi systems reaching a spot, and you can show th ebuilding manager, very quickly and simply, just how many other WiFi routers are active, which channels they are on, and how powerful they are. And at the same time--that will show you if that's a good spot for yours, or if there are too many other users in the same location anyhow.

Of course, if you can sneak up there and check it out before you speak to him...<G>...even better to be prepared.

If he doesn't want to be bothered, OK, he doesn't want to be bothered. You might want to look for some pitch for building managers in general, that gives them some benefit from letting you locate in their space. (Tax deduction, emergency communications, good PR, cash in hand...whatever.)

1879. Re: [ntms-hsmm] Was: HSMM-MESH Interference, site considrations

Yahoo group: DAWG-HSMM
Date: 2010-05-21 17:16:12 UTC
From: Glenn Currie
Topic: 1862 Message: 1879

Good luck with your search for a good site.

If a site is technically in a good spot, then the effort falls more into a diplomatic and / or a political one. I will touch on this in my Hamcom 2010 presentation.

We started off our HSMM-MESH efforts to augment the existing ARCHES amateur radio stations in Austin area hospitals. Once we got all the technical issues solved for that network, the expansion of a microwave backbone in the area and sharing the technology with other hams has expanded the project.

Without good microwave sites, a project will not gain much coverage. Microwave needs Line of Sight locations in order to work, but like any linked radio system, it takes a lot of time and effort to gain wide coverage, and finding good host sites is essential.

I guess since it is not a technical subject, I have not found much ARRL material that deals with getting good sites for radio relays. Finding good sites has become more and more a challenge. We find that radio towers and tall buildings in Austin, are often owned by some company in New York, City. Instead of checking with a local TV station or a local owner of a tall building for a radio site, we are left to write letters to
a New York address. Needless to say, the owners generally do not have much interest in what we are attempting to do, even if they understand it.

Another thing that has changed over the years is the deployment of cell telephone towers, and cell sites on tall buildings. The cell companies pay a hefty monthly fee for rental of the space. Often when hams come along, the landlord has expectations set by what rental rate they get from a phone company. Most are not familiar with ham radio and, free space for radios just makes no sense to them.

While it has not caught on, I had suggested, several years ago, that the local radio club have a relay site committee to work year round, year after year, to secure relay sites. Since it sometimes takes years to negotiate a site, and the effort is getting ever more challenging, it would seem to make sense to have a list of various types of ham radio emergency radio gear that would be helpful in our area and have some hams working to secure sites, on an on going basis.

One other thing that we have to deal with is the ebb and flow of interest in emergency preparation of any kind, once a few years have passed since the last disaster. Once the storms like Katrina, Rita and Ike are a few years in the past, the urgency and potential support for emergency radio systems tends to diminish.

One thing that I have done in the Austin area is to scout out easy to access microwave relay sites and have portable equipment ready to deploy at known good locations. The sites include a collection of open parking garages and local high spots we can access in the area. If need be, we know how to set up portable relays to get around many sites ion our area. We have several really good locations where multiple relatively long

range links can be used to serve as a microwave nexus site. From one site, as many as 6 point to point links can be made, linking multiple sites around town.

While it is good to have enough fixed sites to have a microwave backbone in an area, we never expect to have the infrastructure and coverage of the cell phone companies, so we need to be adept at setting up portable links. Each New Years day, a few of us go out and try links from a variety of locations in the field in a type of microwave field day exercise. We pick out a number of sites that look workable on topo maps and go out and see if, indeed, we can set up links from the locations.

So portable gear can be used to temporarly expand a HSMM-MESH network for a particular incident.

At some point in the future we hope to have most of the hospitals and a few other host sites set up as store and forward sites for a type of networking the military uses called Disruption Tolerant Networks, where the design is such that most nodes in the network are not connected most of the time. This is the opposite of the old model where you expected wired network connection to be on line almost 100% of the time.

With store and forward computer servers running at key fixed sites, a ham driving by in a vehicle would pass data every time they drove by one of these sites. They would serve as what is termed a "data mule" where data is physically transported for part of its journey to its destination. We have found that there is plenty of time to pass significant data driving by a fixed node at 70 mph. There is some interesting antenna design with for and aft aimed yagis that I have done that shows that one can usually maintain a link for several minutes while driving past a site near I-35 as it passes through Austin, at 55mph (we never speed right?) In rush hour vehicle traffic, you could relay massive amounts of radio message traffic.

Considering you can pass the entire ARRL handbook in well under 1 minute on a good link, you do not have to maintain a connection for long if both systems are constantly looking for nodes coming into range. Hospitals are always located on major roads to allow for better ambulance coverage of an area.

So, for example sitting in the drive way over night a mobile node in a car or truck, could buffer messages in Round Rock, Tx. north of Austin. Then the next time the ham that owned the vehicle drove into Austin, data would get passed to other nodes, somewhat as a honey bee pollinates plants.

We have done some work with small, low power computers that have solid state disk drives, no fans - no moving parts. These are not massively powerful computers by todays standards, but they work fine for specialized sub systems of digital radio systems - another presentation.

The application software that runs on top of the basic HSMM-MESH network, would need to collect messages, discard duplicate messages and pass the information on to other servers in the network. While it could possibly work on a dense HSMM-MESH network, it could also have a model where the messages are sent to a central server on the Internet, somewhat like APRS data.

There are people in the academic and DARPA funded research fields that are actively producing papers and software to do the sorts of things I just described.

Such systems are already in use in places like India, where the buses that go between towns serve as data mules to pass data, coming and going, for people in each town. The system is used due to having little to no infrastructure in place. This is pretty much the same problem faced in disaster emergency communications - whatever infrastructure was in place is gone or non functional, so DTNs and data mules are very robust, you control the infrastructure and they can continue to operate under the worst of conditions.

For emergency work, it is good to control all the infrastructure, because in an emergency the only thing that works is what you brought with you. But as APRS has found many uses over time, so will HSMM-MESH. In fact another whole presentation could be made on passing APRS packets via HSMM-MESH. No need to reinvent that wheel.

Enough for now, but keep in mind that portable and mobile HSMM-MESH nodes have a lot of applications. HSMM-MESH is not just for fixed links.

During real emergencies the local Red Cross does not have enough physical space to house all the helpers. With the HSMM-MESH live at the Red Cross, and linked into their network, hams can sit in the parking lot, or even down the street and help pass traffic, without having to physically be in the over crowded building. Just pull up with your mobile HSMM-MESH node and laptop and you are in as soon as you come within RF range.

Food for thought.

I did 10 miles on May 15 for about 5 hours during the Wild Ride bicycle rally.

I set the number to 20000 m and it rounded down a little. But it worked.

I am not aware of a maximum value but I have not tried higher than 20000 because I have not needed to.

From: Glenn Currie
Topic: 1883 Message: 1884

I am not sure how far you got with the update.

After the firmware load of HSMM-MESH(tm) version 0.3.3 you will need to go to the GUI at the base address plus port :8080. Are you doing this?

ex.

KD5MFW-016:8080

takes me to the GUI for mesh node http://localnode:8080. On previous versions of the firmware you did not have to type in the :8080 port number.

Also, be sure you go to the setup page and set whatever you like then you MUST click the button that saves the changes. Even if you make no changes, the first time after a new firmware load, you must go to the set up page and save changes. This saves needed settings to the flash memory.

If you continue to have problems, try holding down the reset button on the back of the router for 30 seconds and see if you can get back into the Linksys firmware and try loading again. This seldom works, but after doing about 100 routers, I find that some have reverted back to the Linksys firmware. It is worth a try.

Give these things a try before I get off into more obscure and less often encountered failure modes.

I recently downloaded and installed the latest version of HSMM-Mesh for one of my Linksys WRT54 V2 routers. Install was flawless until I started messing with the configuration options and ended up with no ability to communicate with the router. I'm not ready to try a reinstall via TFTP yet. Router doesn't necessarily seem to be 'bricked' from what I see on the status lights. Any advice for this HSMM-Mesh newbie - on, or off the list?

Thanks in advance.

```
John,
Remember that the new version, 0.3.3, of the firmware now uses
port 8080 for the Web server. Hopefully, you were using 'cached' data
by your browser to start configuration process which wouldn't get a
response from the AP's from the server when a button was pressed.

Any help??

Thanks for the thoughts Rusty and Glen. I should have supplied more information in my first post...

I believe the update was successful. I accessed the GUI (using port 8080) a number of times after the firmware load. I saved changes and rebooted each time. The installation instructions are well done - very clear and precise. I think I did something stupid while I was 'playing' with configuration settings.

I also tried the reset button. First, holding down the button with the power on (although perhaps not a full 30 seconds) and a second time holding the button down and then applying power. No joy either way. I've been wrestling with this for several days now, so both the computer and the router have been recycled several times.

I did 10 miles on May 15 for about 5 hours during the Wild Ride bicycle rally.

I set the number to 20000 m and it rounded down a little. But it worked.

I am not aware of a maximum value but I have not tried higher than 20000 because I have not needed to.

From: Glenn Currie
Topic: 1883 Message: 1888

It is possible that somehow you changed an address on the set up page that is keeping you from getting into the GUI.

I have had to use the TFTP load a few times. You have to try it a few times to get the timing right for it to sync up and load the firmware, but it does work. I have worked with probably well over 100 different WRT54G units, of all the usable model numbers and have reflashed many of these units 5 or 6 times, some even more, so I have seen a lot of failure modes.

One of the problems is that without a lot of test gear, it is very hard to tell exactly what went wrong. If the router seems to still be alive, try plugging your laptop into one of the LAN ports and run a packet sniffer like Wireshark. See if you get assigned an address and see if the address seems to be one that is mentioned in the HSMM-MESH firmware documentation. If you find one that is close, possibly you had a typo when changing an address.

If you see an address in Wireshark, try looking at port :8080 on that address and addresses near that address, changing the lowest octet in the address. You may get lucky and find the GUI port somehow got moved. If you can get back in, try to get to the set up page and click on the button to select default settings and save the values. If that works, you are probably back on track.

If you cannot get back in to the Linksys 192.168.1.1 address, the firmware load worked and you have HSMM-MESH firmware loaded, but misconfigured.

At this point it is worth trying the TFTP load. I have done it several times and it did not take long to get a fresh firmware load with workable settings.

From what you describe seems a configuration problem, not a hardware problem. I have had routers develop hardware problems and that took a long time to track down.

Try the TFTP load and let us know how it goes. That is what I would do at this point.

Good luck.

Topic: 1880 Message: 1889

I would urge you to do as much as field testing with the distance parameters and see if you can clearly verify what it seems to do. Quite a few of the settings for the Broadcom chip in the WRT54G are not openly documented. Broadcom does not make a data sheets on their chips to available to most people. So a number of the settings are intelligent guesses and the result of reverse engineering.

I have collected what information I can on the major chips used in many wireless routers and I have no definitive information as to how any distance parameter on the Broadcom chip in the WRT54G works. So the setting may work as assumed, or it may work sort of like assumed, or it may not change anything noticeable, as far as I know.

For some things like setting which antenna does what (which one is TX, which one is RX and diversity mode) could and was directly tested and verified. A number of settings are much harder to test and be sure they are working as expected. One setting might be a "auto" mode. If someone has definitive data from a data sheet or field testing, please share, other hams need this info and it is hard to get good answers.

One reason for making the HSMM-MESH firmware available is to get more users to help test the firmware. We do a lot of testing, to be sure there are no bad bugs, but need help testing some things that either take a lot of time, or special test gear or a test range.

If I have misunderstood your statements or questions, forgive me. I think the comments on verifying, as best you can, settings with field work would be most useful, no mater what firmware you are using. Not all the settings in some of the factory firmware works as advertised.

If you can do some field testing where you can try different settings with radios at a variety of distances, please share you results.

But try to verify the distance parameter is working as expected.

I have made dependable links at 10 miles many times. I have made one link at 15.67 miles and I never adjusted anything to do with a distance setting. In some firmware there was no way to make such an adjustment.

Glenn,

Thanks! Good points! It has been decades since I did any "code work", so I am happy to simply test, ask, report, etc. Back in "the day", I was using X.25 over various systems and paths ranging from a few miles via UHF radio to geosat ops. You can imagine that things like the number of packets in flight without ack and packet length were key to making the geosat configuration usable.

We will be trying tests on Field Day with a tethered balloon carrying a HSMM-MESH WRT54GL in Brookshire, and on August 21st with a free-flying balloon to as high as 100K feet from Wharton with lots of ham things. Perhaps we will learn enough on Field Day to determine if this communications medium is useful for the BIG flight in August. We have done voice repeaters, data collection, APRS, ATV etc. via balloons since 1990, but we have always wanted to do WiFi...

So here we are!

The horizon at 100K feet is 390 miles (628K meters) out...

Thanks again!

Sounds like a great project. Please share your results and findings. Some of us have been working on HSMM projects for about 8 years now. Once we got HSMM-MESH to where it did all we needed for a local hospital network, we decided to turn the code loose and open up development and testing for whatever people wanted to try.

On our test adventures, we try to keep as many types of logging going as possible. This includes running WireShark on the link so we can capture every packet that is sent. After the experiment the logs can be shared and observed actions can be matched up with the logs. For a few things you can easily figure out what happened, but for many things, the logs provide a window on what occurred. You probably have some sort of testing figured out, but just for consideration, we often start a "ping" to several nodes in the mesh and as we go mobile, we have the packet sniffer going. The pings and related delays, success for failures show up in the log.

We also use IP cameras and you can see in the logs were the link is solid then gets ragged then gets better again, in the log. Just like telemetry from space probes, the logs can be studied long after the experiment was run. The pings usually present a small load, where as the IP camera provides a steady flood of data.

NetStumbler or better Kismet, records signal strength. As your mesh nodes ascends, you should be able to go back in the NetStumbler or Kismet logs and see what happens with the signal. When you find the limits of your link, you may see where the signal strength was OK but packets start to get dropped at an ever increasing rate. By comparing signal strength vs. packet loss, you might be able to catch a situation where you had enough signal but a lot of packets got dropped, and this would give a clue that some of the software settings like distance / range are making themselves apparent.

Interesting experiment! Keep us posted.

1892. Re: [ntms-hsmm] Maximum Range?

Yahoo group: DAWG-HSMM
Date: 2010-06-24 21:42:34 UTC
From: ag5rs
Topic: 1880 Message: 1892

I am working with Andy and the group in this experiment. I really like your idea of using Kismet and WireShark and will set that up this weekend when we test fly.

I have a different question related to the Ubiquiti Picostation 2 HP that I have. I notice that I can flash it with DD-WRT successfully, but only if I buy a license. Does HSMM-Mesh completely wipe things and reflash or just modify what is there (incremental install)?

Ubiquiti has instructions for putting ROBIN (OpenMesh) on the Pico so I expect there must be some level of compatibility.

Has anyone tried HSMM-Mesh on the Ubiquity products (and gotten it to work)?

My persistence for the Pico is because it has +29dBm out and weighs less than 100g.

Thanks in advance for any help.

1893. Re: [ntms-hsmm] Maximum Range?

Yahoo group: DAWG-HSMM
Date: 2010-06-24 22:18:01 UTC
From: Glenn Currie
Topic: 1880 Message: 1893

Ron,

I do not personally know of anyone that has loaded the HSMM-MESH firmware on a Ubiquiti product. I have some of their routerboards and modular 802.11a and 802.11b radios. I have not had time to try loading HSMM-MESH firmware.

So I am not quite sure if they are using some sort of two stage load or whatever. Ubiquiti says they ship open-wrt firmware with the routerboard. HSMM-MESH started out with the Kamikazi load of open-wrt so I am sure HSMM-MESH will run on that board. Open-wrt has a modular way to load plug-in packages like OLSR, network time protocol and several others. So this is a bit of a two stage load - load open-wrt or HSMM-MESH, then plug in packages can be loaded in without reloading the firmware.

Such plug ins are stored as files on a simulated file system in the router and this makes them modular. So you can change plugins without having to recompile and load a monolythhic fimware image.

As for the exact load sequence and memory map of the Ubiquiti Picostation, I really have no good advice. Given time we might be able to figure something out. But I have nothing definitive at this time. I have not worked with the device.

If I had to guess, some work is needed and the HSMM-MESH firmware would not cleanly load on top or side by side with their product that requiers a license. And I do not know how open they would be about providing an interface API. All good questions with no good answers at this time.

There are people charging a fortune for mesh nodes while they can and most are not open to telling what they have inside. The routerboard can be made to work, I am sure, but I need time to work with it. The other products are more compact, probably have less memory but I can see the appeal - they are real small.

Good luck and keep me posted as to what you find out.

-Glenn

I am working with Andy and the group in this experiment. I really like your idea of using Kismet and WireShark and will set that up this weekend when we test fly.

I have a different question related to the Ubiquiti Picostation 2 HP that I have. I notice that I can flash it with DD-WRT successfully, but only if I buy a license. Does HSMM-Mesh completely wipe things and reflash or just modify what is there (incremental install)?

Ubiquiti has instructions for putting ROBIN (OpenMesh) on the Pico so I expect there must be some level of compatibility.

Has anyone tried HSMM-Mesh on the Ubiquity products (and gotten it to work)?

My persistence for the Pico is because it has +29dBm out and weighs less than 100g.

Thanks in advance for any help.

1894. Final Call for Papers & Speakers at 2010 ARRL/TAPR Digital Communications Conference (DCC)

Yahoo group: DAWG-HSMM
Date: 2010-07-09 18:58:17 UTC
From: Mark Thompson
Topic: 1894 Message: 1894

Speakers are encouraged to make presentations at the Digital Communications Conference (DCC).

Presentations can be made at the DCC even if you don't submit a technical paper.

Speakers may be accepted after Call for Papers has closed, but TAPR needs to be aware
in advance of your interest to speak at the DCC.

Final Call for Papers--2010 ARRL/TAPR Digital Communications Conference
Posted by: "Ford, Steve, WB8IMY" sford@... wb8imy
Date: Thu Jul 1, 2010 1:29 pm ((PDT))

Technical papers are solicited for presentation at the 29th Annual ARRL and TAPR Digital Communications Conference to be held September 24-26, 2010 near Portland, Oregon. These papers will also be published in the Conference Proceedings (you do NOT need to attend the conference to have your paper included in the Proceedings). The submission deadline is July 31, 2010. Please send papers to:

Maty Weinberg
ARRL
225 Main St
Newington, CT 06111

or you can make your submission via e-mail to: maty@...

Papers will be published exactly as submitted and authors will retain all rights.

Hello to all Radio Amateurs;

I just want to extend an invitation to you to come to St Louis, MO for the 44rd annual Central States VHF society's annual conference. If you have any interest in the VHF and UHF weak signal activities, this gathering is for you. This year the conference is being held at the Doubletree Hotel St Louis at Westport, near I-270 and MO 364, on the dates of July 22 through the 25th.

The conference starts with registration on Thursday (7/22) evening, with a social gathering, and registration extends through Friday, July 23, with antenna measuring, preamp measuring and talks/seminars also scheduled throughout the day. On Saturday, the seminars continue, and a banquet and prize drawing are featured that night. Other features include a dealer display, of VHF/UHF goodies, flea market, family program with tours of many attractions in and around St Louis, rover and antenna displays, and lots of socializing with familiar voices, which allows you to meet many of those with whom you have been QSOing with.

Much more detailed information on the 44th conference can be found at the website; http://www.csvhfs.org, including links to the hotel for those who plan to stay the duration, and a link to an online registration page for conference registration. Many in the St Louis area may opt just to attend for the day on Saturday, but come and join us for the entire weekend if you can.

For more information, you can contact me here, at the address in the header, or please send an email to Ron Ochu, KO0Z, the conference host. He can be reached at ko0Z{at}arrl.net

Thanks for considering, hope to see you in St Louis!

I am planning to attend the Central States VHF Society Conference since it is here in St. Louis. Is anyone coming from the North Texas High Speed Multimedia group. I would like to get together with anyone that is coming up as I have been putting together a network here in St. Louis and maybe we could have lunch or dinner and discuss our mutual interests.l

1897. Questions about multiple HSMM-MESH nodes

Yahoo group: DAWG-HSMM
Date: 2010-07-18 22:24:54 UTC
From: Todd Caldwell
Topic: 1862 Message: 1897

Hello everyone,

I'm looking at an installation that would require 3 nodes, each with a 120 degree sector antenna to get full omni coverage. An additional narrow beam point-to- point link might also be desirable. All 4 nodes would be within perhaps 30 feet of each other, but the structure precludes using a single omni. This is a nice high location, so considerable range may be possible.

For these nodes to communicate with each other, can I connect the nodes together via ethernet ? WAN or LAN ports if so ?

The overall intent here is for this installation to be a reasonably wide area relay node for ham and emergency data use.

Info will be appreciated.

Thanks,

Todd Caldwell - K5SLR

From: WILLIAM WALLACE
Topic: 1862 Message: 1898

I have the exact same question. I guess as we try to plan a network for this function we run into a situation where we have a need for a relay point that needs more than an omni antenna to tie our other locations together.

I have not played with it yet, but it was supposed to be working in version 3.3. It was one of the setups.

The nodes are connected by ethernet. It allows us to come in one router on say Channel 1, and connect to another router by ethernet cable which can use another channel or another SSID.

For nodes that didn't have a good signal between omni's, I planned to use 2 antennas on a node. An omni for local coverage and a directional to get a better signal to another node. As far as I know there is no reason not to have 2 antennas on a node. With diversity RX, the radio should transmit any replies on the antenna it received the request on.

1901. AMSAT 2010 Space Symposium Call for Papers

Yahoo group: DAWG-HSMM
Date: 2010-07-20 04:38:13 UTC
From: Mark Thompson
Topic: 1901 Message: 1901

AMSAT 2010 Space Symposium Call for Papers

The September 1 deadline of the call for papers for the 2010 AMSAT Space Symposium and Annual Meeting is rapidly approaching! So far the Proceedings crew has received two abstracts for papers - thank you!

The abstract for your paper does not require any special format. Simply send an e-mail to the Proceedings Editor, K9JKM with the basic information: Author Name, Callsign, and a few sentences that describe your proposed topic. I'll be looking forward to receiving your abstracts in my in-box at k9jkm@....

The Symposium Committee invites proposals for:

+ Papers for publication in the Proceedings

+ Symposium Presentations

+ Poster Presentations

+ Equipment and Operating Demonstrations

These can be on any topic of interest to the amateur satellite community. We request a tentative title of your presentation as soon as possible, with final copy submitted by September 1, 2010 for inclusion in the printed proceedings.

To help you prepare your paper the Symposium Committee has posted an author's guide on the AMSAT.org web page:
http://tinyurl.com/2djjnmx

The 2010 AMSAT Space Symposium and Annual Meeting will be held October 8 - 10 at the Chicago/Elk Grove Holiday Inn which is near O'Hare Airport.

73,
JoAnne K9JKM
2010 Symposium Proceedings Editor

1902. Re: [ntms-hsmm] Questions about multiple HSMM-MESH nodes

Yahoo group: DAWG-HSMM
Date: 2010-07-20 05:04:11 UTC
From: Glenn Currie
Topic: 1862 Message: 1902

I have forwarded the question regarding the use of multiple mesh nodes to some of the HSMM-MESH developers.

There are multiple ways to connect the nodes. Please include as much information regarding the site as possible. Do not assume the solution, just describe the location as clearly as possible and your goal(s) as clearly as possible. I am confident some solutions are not imediately obvious. The structure that was to be used to mount the mesh nodes on was now described in detail.

There are probably multiple solutions. With more information we can home in on a more optimized one.

From: Steve W3AHL
Topic: 1862 Message: 1903

The dual antenna ports are intended only for spatial diversity of two similar antennas mounted 1-4 wavelengths apart (5-20" at 2.4 GHz)covering the same area. The diversity logic selects the antenna with the best signal quality (lowest group delay) based upon multipath interactions.

Using antennas with different characteristics to cover different areas may seem to work in initial testing, but will result in unusable links when the traffic picks up a little.

Refer to:
http://www.cisco.com/en/US/tech/tk722/tk809/technologies_tech_note09186a008019f646.shtml

The golf course example toward the end addresses why your proposal doesn't work.

In practice the guys in Austin have not had any problems with using different antennas on the two ports of a WRT54G. I questioned them on this also, and they assure me that in practice it works.

A lot of times they use a omni for local mesh connections and a directional (most often horizontal polarity) for long distance. I have not tested this but believe the group in Austin know what they are talking about. It does work and they have not seen any bad effects.

1905. Re: [ntms-hsmm] Re:Questions about multiple HSMM-MESH nodes

Yahoo group: DAWG-HSMM
Date: 2010-07-20 18:07:56 UTC
From: Glenn Currie
Topic: 1862 Message: 1905

Thanks for all the info and interest. Here is some info to consider. I hope it is helpful.

Please get some of this gear and get out in the field. It is fun and there is a HUGE amount to learn and share with others!

I have found that mixed antennas, linking different nodes does work. I am also sure the design application notes provided, contain useful information. Most of the things we are doing with the WRT54G are not what it was designed to do and nobody provides detailed information for our applications.

Broadcom, who makes the main chip inside the WRT54G does not make detailed information available to users, just major vendors. The vendors provide information for the products they design, and how they intend for them to be used.

--

We have HSMM-MESH(tm) firmware stable and have released it for free for other hams to experiment with and report their findings. Some hams are already using HSMM-MESH(tm) in ways the developers had not expected or tested! The system is wonderfully (confusingly) flexible.

So we have a situation were the vendors supply some interesting products but very limited information. We have little choice but to experiment and share findings.

Distance, throughput, environmental conditions vary widely and we are not using the equipment in a living room or office for the most part, so we are on our own. This is radio and the analog physics apply - and they are complex if you want to get deep into the details. We cannot expect maximum throughput in all cases. There are always trade offs and due to the complexity of the radio, not all the trade offs are immediately apparent, I assure you.

Also, the HSMM-MESH(tm) developers main interest is quickly deployed emergency communications. If we can get a link that is usable, it will beat a 1200 baud packet link in speed. So we declare victory in such cases and move on. We do not have definitive information for every possible use of the firmware and hardware. That is one of the main reasons we released the firmware - to get help in discovering what will and will not work.

No system can be optimized for all possible cases. So if you trade off some throughput for a particular configuration, does that work well enough for your purposes? If so declare victory. If not, do some more field work. Try placing multiple nodes in various locations and work towards an acceptable solution. There are usually multiple ways any particular site can be configured. Your first idea might not be what ends up working best. The radios can be set to do antenna diversity, and they do so many things to maintain a link it would fill a book to try to describe. (See the book by Gast on 802.11 - it is a thick book for a good reason - lots and lots of details - tons of them). We all value simple answers and rules of thumb, but these radios and antenna systems are complex by their nature. You

should not expect to know everything about how to use them without some effort. Understand the basics then try some field work when the
thick books make you sleepy. You can be safe and not not bother other people easily enough. But digital microwave broadband communications is not a simple topic.

So what is going on with the radio is very complex, self adapting, not documented in detail by the maker, and would require a lab full of very expensive test gear to fully track and understand. Few hams have all the test gear to fully instrument a WRT54G and even attempt to fully describe everything that it is doing in a particular application. So we trade information and see what works and what does not work.

Unmatched antennas on a mesh node do work, and I am confident that in most, possibly all cases it cuts throughput. But if you do not have enough gain and directivity on a link to make the trip, your throughput is zero. So I see no conflict in the information, just more pieces of a very complex analog puzzle. One should not expect maxim throughput in all cases in all places. All we can do is to share our experiences and figure out what will work for a particular situation.

I have been working with the WRT54G and similar device for several years. I have a pretty good feel for what works consistently around where I live in the Austin area. I wish I had all the test gear to do definitive testing and measuring of everything. That is not going to happen. I really encourage you to do field work as I have found a lot of what works and does not work, is counter intuitive. The theory is great, but without tons of technical information on the hardware, you really have to experiment. You cannot sit at a desk and fully design and model a system then just go set it up and expect it to work every time. We simply do not have enough information to feed into a model to do that. You would need a detailed site survey, for one thing, and somebody has to go out in the field to do that work for any model to be of use.

I am happy to share what I have learned in about 8 years of field work. I cannot stress enough that some of how the radios consistently work, seems counter intuitive, at least to me. So if I had not done the field work myself, and just did thought experiments, I would have been dead wrong on a number of important issues. So collect all the good info you can, work out a plan and give it a try. Sometimes it just works, sometimes it does not. I have found more links worked than I would have guessed when I first started.

73's

-Glenn

Examples:

The 2.4 GHz band is full. Yes it is and we still consistently, at will do 10 mile links across Austin. Don't sit on the couch and think that it is not worth trying.

Slap on a big RF amp before you even try a link, it has to make things better.
Nope. We do our 10 mile links with simply good antennas on stock WRT54G hardware.
You MUST have good sites. If you do not have Line of Sight, then an amp is not usually going to do any good unless you can burn a hole in obstructions to obtain a line of sight path.

Not all locations will work. There can be bad interference that causes problems. This is true no mater how expensive your equipment or how much you would like the link to work.

So the make your best guess, collect your gear and get out in the field and try stuff.

1906. Re:Questions about multiple HSMM-MESH nodes

Yahoo group: DAWG-HSMM
Date: 2010-07-20 20:27:13 UTC
From: Steve W3AHL
Topic: 1862 Message: 1906

I agree with much of Glenn's philosophy regarding hams having fun and getting field experience. But having spent over a decade engineering ruggedized wireless equipment for industrial use and also having experience with a working HSMM network, I still believe there is value in understanding the technical aspects of the equipment you are working with and purposefully designing a somewhat reliable system.

Throwing things together to see what works has its place. But if the goal is to develop a backup data network for served agencies, following the manufacturers' specifications is a good thing, unless you understand why the constraints don't apply to this specific application.

I have seen exactly the situation described in the Cisco app note on diveristy antennas. In a large distribution warehouse several AP's in the freight yard had the gain antennas' directions tweaked to improve coverage, creating multiple cells and defeating the primary purpose of improving data throughput when multipath distorts the signal.

The customer's "network engineers" tested it and declared it good. But then spent months trying to solve poor throughput, dropped connections and poor roaming in the freight yard as the number of clients increased.

There is little magic in the access points and the RF network design. Most of it can be understood with a little research and discussion with others knowledgeable in the field. You will seldom go wrong by following the manufacturer's specifications and techncial notes, if the goal is to design a relaible network. If the goal is to test the limits and see what can work some of the time, then go ahead and have some fun. Just don't sell it to your hospitals and EOC's as their backup data network.

Using the diversity reception as intended will do much to enhance long term link stability. If you need to cover multiple areas, do it right and add a second AP with the right antennas for that link, if you are doing this for a real network and not just out to have fun.

Topic: 1862 Message: 1907

Following up on the mention of 'testing limits' I was wondering if anyone is using HSMM and Asterisk together in an Ecomm environment?

To: ntms-hsmm@yahoogroups.com
Subject: [ntms-hsmm] Re:Questions about multiple HSMM-MESH nodes

I agree with much of Glenn's philosophy regarding hams having fun and getting field experience. But having spent over a decade engineering ruggedized wireless equipment for industrial use and also having experience with a working HSMM network, I still believe there is value in understanding the technical aspects of the equipment you are working with and purposefully designing a somewhat reliable system.

Throwing things together to see what works has its place. But if the goal is to develop a backup data network for served agencies, following the manufacturers' specifications is a good thing, unless you understand why the constraints don't apply to this specific application.

I have seen exactly the situation described in the Cisco app note on diveristy antennas. In a large distribution warehouse several AP's in the freight yard had the gain antennas' directions tweaked to improve coverage, creating multiple cells and defeating the primary purpose of improving data throughput when multipath distorts the signal.

The customer's "network engineers" tested it and declared it good. But then spent months trying to solve poor throughput, dropped connections and poor roaming in the freight yard as the number of clients increased.

There is little magic in the access points and the RF network design. Most of it can be understood with a little research and discussion with others

knowledgeable in the field. You will seldom go wrong by following the manufacturer's specifications and techncial notes, if the goal is to design a relaible network. If the goal is to test the limits and see what can work some of the time, then go ahead and have some fun. Just don't sell it to your hospitals and EOC's as their backup data network.

Using the diversity reception as intended will do much to enhance long term link stability. If you need to cover multiple areas, do it right and add a second AP with the right antennas for that link, if you are doing this for a real network and not just out to have fun.

there is a HUGE amount to learn and share with others!
>
> I have found that mixed antennas, linking different nodes does work.Â I
am also sure the design application notes provided, contain useful
information.Â Most of the things we are doing with the WRT54G are not what
it was designed to do and nobody provides detailed information for our
applications.
>
> Broadcom, who makes the main chip inside the WRT54G does not make detailed
information available to users, just major vendors.Â The vendors provide
information for the products they design, and how they intend for them to be
used.
>
> --
>
> We have HSMM-MESH(tm) firmware stable and have released it for free for
other hams to experiment with and report their findings.Â Some hams are
already using HSMM-MESH(tm) in ways the developers had not expected or
tested!Â The system is wonderfully (confusingly) flexible.
>
> So we have a situation were the vendors supply some interesting products
but very limited information.Â We have little choice but to experiment and
share findings.
>
> Distance, throughput, environmental conditions vary widely and we are not
using the equipment in a living room or office for the most part, so we are
on our own.Â This is radio and the analog physics apply - and they are
complex if you want to get deep into the details.Â We cannot expect maximum
throughput in all cases.Â There are always trade offs and due to the
complexity of the radio, not all the trade offs are immediately apparent, I
assure you.
>

> Also, the HSMM-MESH(tm) developers main interest is quickly deployed emergency communications.Â If we can get a link that is usable, it will beat a 1200 baud packet link in speed.Â So we declare victory in such cases and move on.Â We do not have definitive information for every possible use of the firmware and hardware.Â That is one of the main reasons we released the firmware - to get help in discovering what will and will not work.
>
> No system can be optimized for all possible cases.Â So if you trade
> off some throughput for a particular configuration, does that work well enough for your purposes?Â If so declare victory.Â If not, do some more field work.Â Try placing multiple nodes in various locations and work towards an acceptable solution.Â There are usually multiple ways any particular site canÂ be configured.Â Your first idea might not be what ends up working best.Â The radios can be set to do antenna diversity, and they do so many things to maintain a link it would fill a book to try to describe.Â (See the book by Gast on 802.11 - it is a thick book for a good reason - lots and lots of details - tons of them).Â We all value simple answers and rules of thumb, but these radios and antenna systems are complex by their nature.Â You should not expect to know everything about how to use them without some effort.Â Understand the basics then try some field work when the thick books make you sleepy.Â You can be safe and not not bother other people easily enough.Â But digital microwave broadband communications is not a simple topic.
>
> So what is going on with the radio is very complex, self adapting, not documented in detail by the maker, and would require a lab full of very expensive test gear to fully track and understand.Â Few hams have all the test gear to fully instrument a WRT54G and even attempt to fully describe everything that it is doing in a particular application.Â So we trade information and see what works and what does not work.
>
> Unmatched antennas on a mesh node do work, and I am confident that in

> our experiences and figure out what will work for a particular
> situation.Â
>
> I have been working with the WRT54G and similar device for several years.Â I have a pretty good feel for what works consistently around where I live in the Austin area.Â I wish I had all the test gear to do definitive testing and measuring of everything.Â That is not going to happen. Â I really encourage you to do field work as I have found a lot of what works and does not work, is counter intuitive.Â The theory is great, but without tons of technical information on the hardware, you really have to experiment.Â You cannot sit at a desk and fully design and model a system then just go set it up and expect it to work every time.Â We simply do not have enough information to feed into a model to do that.Â You would need a

detailed site survey, for one thing, and somebody has to go out in the field to do that work for any model to be of use.
>
> I am happy to share what I have learned in about 8 years of field work.Â I cannot stress enough that some of how the radios consistently work, seems counter intuitive, at least to me.Â So if I had not done the field work myself, and just did thought experiments, I would have been deadÂ wrong on a number of important issues.Â So collect all the good info you can, work out a plan and give it a try.Â Sometimes it just works, sometimes it does not.Â I have found more links worked than I would have guessed when I first started.
>
> 73's

Greetings,

On Tue, 20 Jul 2010, Dave wrote:

> Following up on the mention of 'testing limits' I was wondering if anyone is
> using HSMM and Asterisk together in an Ecomm environment?

Yes, sort of... As our first deployment and test of HSMM-MESH we deployed a handfull of MESH nodes around a 420-acre private campground in Northern Michigan where we held our ARRL Michigan Section Summer Family Outing (an annual 4-day campout for Hams and their families with activities and forums for the attendees). Off of those MESH nodes we attached standard Access Points. Off the main MESH node we attached a cellphone Internet connection.

Every laptop on the campgrounds now had access to the Internet to check mail and surf the web. We also had a number of SIP WiFi handsets that registered to an Asterisk server back in Ypsilanti Michigan and provided access to the PSTN as well as could call each other.

This all worked wonderfully and quite dependably :)

Attention to the "evils" of doing NAT, and taking care to set 'default' routes correctly meant for a smooth running field deployed network.

Any particular model WiFi handset that would be good to pick up and
experiment with these days?

Thanks,

All the hams of Lucas, Texas NEED YOUR HELP !

My next door neighbor has requested that the city of Lucas establish a new tower ordinance.

I have attached to this email, in an Adobe pdf file, his communications to the city.
His letter is public record and I secured it via a request for public information.

If his request was to be tuned into an ordinance it would, among other things, effectively kill off the use of any YAGI antenna for HF/VHF/UHF/MW and inhibit you from attaching ANYTHING to the tower including wire antennas and any support ropes for them. As requested it would also inhibit you from attaching a vertical antenna (VHF/UHF) to the top or side of the tower. In effect making it pointless to install a tower WHICH is his goal.

He also requested that towers be limited to one in quantity with a max height of 50 feet.

The purposed ordinance is tentatively scheduled to be on the Lucas Planning & Zoning agenda for the September 9, 2010 meeting.

The meeting start at 7 PM and takes place in the new Lucas city hall located at 665 Country Club Lane.

We need to PACK the room with hams, even if you do not live in Lucas, as non-sense like this tends to have ripple effects into other communities and their ordinances.
.
PLEASE place the date and time on your calendar and make it a priority to attend.September 9, 2010 meeting at 7 PM.

One last note - The major of my antennas are up and my installations will be grandfathered in.

My effort is to protect all of the other hams in Lucas that may want to install a tower in the future.

Please come and help protect all of our amateur radio interests.

Google "PRB-1 Texas" for information on state statutes that limit restrictions that municipal governemnts can impose on amateur tower and antenna installations.

While is is always good to have a large crowd show up at a meeting to support an issue, it is even better to present a factual, legal arguement invalidating the proposed restrictions.

Contact the ARRL to enlist professional resources in your state familiar with Texas code 250.002 "Regulation of Amateur Radio Towers".

While I'm not very active on this group, I can offer a suggestion regarding this topic as well. Here in Delaware, we had a cell phone bill passed that was so inclusive that it would have stopped all mobile use of Amateur Radio in a moving vehicle unless it was "hands free". We gathered a large group of Hams (remember Delaware is a very small state) and armed them with "educational" material regarding the uses for Ham radio during emergencies. That coupled with the fact that a few of us knew our state senators and representatives well enough to ask them to sponsor and co-sponsor a new bill that removed the restrictions for mobile use of Ham radios. It worked very well. They were impressed with all of the quality information we provided and with the fact that so many interested parties were there at Legislative Hall for two days. The vote was unanimous in both houses.

Check out Garland Texas Tower Ordinance. When I was on the Garland City Council I worked with ARRL and we were able to pass a very enlightened ordinance that removed the arbitrary limitations set up to discourage Amateur Radio. You can see it in the Code of Municipal Ordinances online at http://www.ci.garland.tx.us and navigate to the ordinances page.

I live in Lucas and will plan on attending the meeting.

I have been to one of the Planning and Zoning meetings in Lucas before to voice my opinion against a proposed zoning change in my neighborhood. I agree with Steve that presenting a valid legal argument will greatly help the cause instead of just standing up and saying "I oppose this ordinance". Although, I think it will also help to have as many people present at the meeting as possible, even if we all stand up and present the same valid argument. That is basically what we did at the meeting I attended. Several people from my neighborhood were present and we all stood up and had our say, which was basically the same argument against the proposal. After the meeting, the Planning and Zoning committee commented that they were pleased to see so many people at the meeting to voice their opinions about the direction of their community. The City council and, from what I have seen, the Planning and Zoning committee are very laid back and do not want to see a bunch of ordinances governing what can and can not be done within the City. They leave that more or less to the HOA's.

There are several examples that show antennas can rarely be restricted by HOA's and City ordinances, but I am not sure that towers themselves are quite as protected as antennas.

I live in a neighborhood that does not have an HOA and I can put up whatever tower I want, and would like to keep it that way.

Be sure to take a copy of PRB-1 with you and present it to them. It says they have to "reasonably accomodate" amateurs. What is reasonable?? Take a picture of W5UN's or K5GW's installation, a picture of yours and a picture of a house with NO antennas. You can call UN and GW's station, "Unreasonable" (although I think it's beautiful!), call yours "reasonable" and the house with NO antennas "unaccomodating".

...worth a try!

There's also a law, may be just in CA, that says no one, including ANY homeowner's association, can stop you from putting up an antenna for free over the air TV reception....regardless of CC&R rules or prior agreements! Check on that....may just be a CA thng. Maybe those are all TV antennas on your tower!

73....KJ6KO

Good Luck!

All the hams of Lucas, Texas NEED YOUR HELP !

My next door neighbor has requested that the city of Lucas establish a new tower ordinance.

I have attached to this email, in an Adobe pdf file, his communications to the city.
His letter is public record and I secured it via a request for public information.

If his request was to be tuned into an ordinance it would, among other things, effectively kill off the use of any YAGI antenna for HF/VHF/UHF/MW and inhibit you from attaching ANYTHING to the tower including wire antennas and any support ropes for them. As requested it would also inhibit you from attaching a vertical antenna (VHF/UHF) to the top or side of the tower. In effect making it pointless to install a tower WHICH is his goal.

He also requested that towers be limited to one in quantity with a max height of 50 feet.

The purposed ordinance is tentatively scheduled to be on the Lucas Planning & Zoning agenda for the September 9, 2010 meeting.

The meeting start at 7 PM and takes place in the new Lucas city hall located at 665 Country Club Lane.

We need to PACK the room with hams, even if you do not live in Lucas, as non-sense like this tends to have ripple effects into other communities and their ordinances.
.
PLEASE place the date and time on your calendar and make it a priority to attend.September 9, 2010 meeting at 7 PM.

One last note - The major of my antennas are up and my installations will be grandfathered in.

My effort is to protect all of the other hams in Lucas that may want to install a tower in the future.

Please come and help protect all of our amateur radio interests.

1918. HSMM-MESH nodes in difficult to access places

Yahoo group: DAWG-HSMM
Date: 2010-07-25 05:49:35 UTC
From: Todd Caldwell
Topic: 1912 Message: 1918

Another question -

We are preparing here in Mesquite to install some nodes up on towers
and other not readily accessible locations.

I seem to recall from Kip's presentation in Lucas back in February
that there is a way to remotely access nodes for software updates and such.

Can someone please refresh my memory on how this works ? I seem to
recall it involving SSH keys, but the details escape me.

Thanks,

Todd Caldwell - K5SLR
Mesquite, TX

The SSH Keys are only for identifying your computer as a trusted computer. It bypasses having to log in, that is all it does. It comes in handy if you happen to forget the login password.

I think you have to ftp the upgrade to a special directory and reboot. I do not think it is documented on the HSMM-MESH.org website yet. I will find out during the week and get back to you.

Rusty should know how to do it.

Certainly the web interface allows one to update the firmware remotely.
The other way, is to 'scp' the .trx file into /tmp of the remote node
and then tell it to execute 'reflash'. The 'reflash' command will update
the flash firmware and then reboot the node.

Keep in mind, that no matter which way you do it, the node will still
revert to an AP with the SSID of 'MeshNode'. Your portable 'puter will
still have to break it's current connection and switch to the new SSID
so you can config the MeshNode (unless you can have another WiFi card
or another laptop). Best not to do multiple AP that are within the same
proximity at the same time -- it will git confusing!!

>> Can someone please refresh my memory on how this works ? I seem to
>> recall it involving SSH keys, but the details escape me.

Having SSH keys in the proper places would simply allow you to do that
'scp' and 'reflash' with 'ssh' (i.e. over an encrypted channel) without
having to re-enter the cotton-pickin' password each time. :-)

Yahoo group: DAWG-HSMM
Date: 2010-07-29 17:07:11 UTC
From: Todd Caldwell
Topic: 1912 Message: 1921

I attended Kip's presentation in Lucas back in February and met quite a few of you there. I've been interested in getting HSMM started in my area since then.

Earlier this month, I mentioned this to Andy Carstarphen - WY5V. He's also been looking into this idea. Andy is the current president of the Ham Association of Mesquite. We talked a bit about it at one of the club's "ham radio in the park" events earlier this month, and got Craig Green, KV5E - our RACES/ARES coordinator, and several others involved.

Things have really taken off since then.

The H.A.M. is now working on establishing an HSMM-MESH network in the Mesquite area. Several of us have nodes and are working our way through learning the system. I'm happy to report that enthusiasm and interest are high at present in the group.

To help each other get set up and handle questions, we've set up a Yahoo group.

http://groups.yahoo.com/group/mesquite-hsmm/

Members of the ntms-hsmm group are welcome to join us. DFW area locals doubly so.

1922. HSMM newbie shopping list?

Yahoo group: DAWG-HSMM
Date: 2010-08-01 16:36:46 UTC
From: wa5jxy
Topic: 1922 Message: 1922

Just curious if anyone has already created a spreadsheet listing the basic (and advanced) components and suggested vendors for newbie's just getting started in HSMM?

It would be a nice handout to help someone get started.

A "Suggested vendors" column is helpful because we all know there are several sources for the same item (Linksys routers) but it would be nice to know who is selling them the cheapest, no hassle, etc.

Same goes with antennas....lots of sources and brands but which one's are the most "recommended"? and where to buy?

And those darn POE's, waterproof cat5 connectors, housings, etc. etc.

I started a spreadsheet, but hate to reinvent the wheel if it has already been done.

Dave,

Not sure which website you are referring to. I am one of the HSMM-MESH developers. I am also working on Asterisk applications. It may take a while, but I will work with you until we sort out the details.

To get started, let me know as much as you can about what you are trying to do. I would also keep in contact with others on this list that have Asterisk experience.

I am busy preparing a HSMM-MESH presentation and demo for Summerfest 2010 here in Austin.

I'm trying to get asterisk set up and plan to then use it via mesh nodes here in Mesquite.

Still on the steep part of the asterisk learning curve here, but I'll be very interested in any information as well.

From: ag5rs
Topic: 1880 Message: 1929

Dave & Glenn,
I have a bit of asterisk experience and a fairly good background in port handling. In particular I have successfully set up Echolink in both Windows and Linux systems. Doing this allowed me to make a contact from Dubai to the South Texas balloon at 22 miles up and back down to several ground stations. Super fun!

I agree with Glenn, in order to help we would need to know what Dave is trying to do exactly. Asterisk is a very broad term and covers many options. For example are you trying to be able to route a SIP or IAX connection through HSMM? Are you wanting to use Asterisk as a phone patch from HSMM to the POTS? Are you wanting to use HSMM as an OPX link for Asterisk? Etc.

I want to learn more about this topic myself and would enjoy helping anyone by sharing what I already know.

1930. Re: [ntms-hsmm] Re: Asterisk & Port Forwarding

Yahoo group: DAWG-HSMM
Date: 2010-08-06 14:43:57 UTC
From: John (WB5NFC)
Topic: 1880 Message: 1930

It looks like I hit a pretty hot topic with my original post. I can't speak for Dave or Glenn, but since I started the thread, I want to jump back aboard before I get left in the dust <g>.

In my case, I am looking for specific guidance on how/where to forward the ports necessary for Allstar (ACID), Echolink and IRLP. My mesh is working and supplying Internet access from one node to the next, but Echolink and IRLP nodes cannot connect. Allstar status shows up in "green" and both Echolink and IRLP status pages show that the nodes are online. The CLI shows that the Echolink stations are being downloaded successfully to my box. I suspect that I am misinterpreting just where to forward the appropriate ports on the HSMM Mesh port forwarding page. Once I get this figured out, I will look at activating SIP ... which I think will be easy once I understand more of what I am doing wrong now.

Thanks to all who contribute time and knowledge to this great project!

Subject: [ntms-hsmm] Re: Asterisk & Port Forwarding

Dave & Glenn,
I have a bit of asterisk experience and a fairly good background in port handling. In particular I have successfully set up Echolink in both Windows and Linux systems. Doing this allowed me to make a contact from Dubai to the South Texas balloon at 22 miles up and back down to several ground stations. Super fun!

I agree with Glenn, in order to help we would need to know what Dave is trying to do exactly. Asterisk is a very broad term and covers many options. For example are you trying to be able to route a SIP or IAX connection through HSMM? Are you wanting to use Asterisk as a phone patch from HSMM to the POTS? Are you wanting to use HSMM as an OPX link for Asterisk? Etc.

I want to learn more about this topic myself and would enjoy helping anyone by sharing what I already know.

1931. Re: [ntms-hsmm] Re: Asterisk & Port Forwarding

Yahoo group: DAWG-HSMM
Date: 2010-08-06 17:03:25 UTC
From: Glenn Currie
Topic: 1880 Message: 1931

Yes it is a hot topic! I you take even a quick look at:

<http://oreilly.com/catalog/9780596009625>

it is clear that it is a very large topic. Users can configure an Asterisk system in many ways. I am one of the original HSMM-MESH developers and it has become clear that even as we push forward with the IP v6 work for HSMM-MESH, many hams would benefit from sharing information on applications. VoIP via HSMM-MESH would be one of the most universally useful applications we could work on.

We could share information via this group or it might be appropriate to set up another group.

Different Asterisk users may have different requirements with what they wish to do with their systems. We started our mesh work to expand our capability with Travis County ARES in the Austin, Texas area. If we were to establish a few conventions, it might make it easier for ARES groups to link their Asterisk systems and train their members to use the system.

"Soft Phones" using the sound card of a PC and drawing a graphic of a phone on the screen is one of the least expensive ways to get started with Asterisk and VoIP experiments, and using them should always be an option, I am confident that many hams and people in served agencies will be more comfortable with a physical phone and handset. One of the key things is keeping training to a minimum, so the more you can set up a system that works like a "regular" phone, the less training you may need to do. I have found that the abstraction of using a soft phone is unfamiliar and unsettling to many.

Also HSMM and various VoIP projects are a great way to attract new hams. So to push the physical phone / handset idea to the logical end, I want to promote using Wi-Fi based cordless (wireless) handsets. These are available for about $150.00 on up from makers like Polycom. The real push I want to make is to make use of the Wi-Fi subsystem in the modern smart phones such as the Apple iPone and similar Android OS based smart phones. These phones ARE amateur radio transceivers! Users should be able to talk through a HSMM-MESH based Asterisk VoIP system using their iPhone.

There is already a Skype app for the iPhone I understand. We we would want is a Wi-Fi based IP-Phone application that would allow us to link to our mesh based Asterisk systems. A sample configuration would be to use HSMM-MESH as part (possibly the bulk) of a system to link ARES users for a particular event. HSMM-MESH supports putting a WRT54G into a normal Access Point mode. In this configuration the 54G is no longer a mesh node, it is a normal AP. You plug the AP into one of the LAN ports on a mesh node and provide a normal Wi-Fi link for an area at a particular endpoint. With this normal AP any normal Wi-Fi device can be gatewayed into the mesh. This would include Wi-Fi based VoIP phones.

So soft phones could would be inexpensive and a way for people that are comfortable with them to access the Asterisk system. Wired IP-phones could be used by served agencies and others. And the smart phone crowd could use the latest phones as amateur radio

transceivers to access the system.

The major building blocks are available. For an iPhone app developer, it would be straightforward to spec an application to tie an iPHone into the system. So round up a few iPhone app developers and get them to get their ham ticket and tell them we need them for a cool ham radio project using the latest gear available!

It is an ambitious project but one that is quite doable. Some coordination of effort would yield a great system - one that has many uses and is fun to work with.

While the tie in of the smart phones is icing on the cake, I want to have something in the project to attract the younger crowd of network savvy developers into ham radio.

If you have an interest in any aspect of such an Asterisk project, let me know. We can keep people on this list informed or start a new list to if it seems we are dragging this list off topic too much.

I will be adding a section to the

hsmm-mesh.org

web page to help with the project.

For those that have Asterisk experience with amateur radio, if you could share some of the specifics (such as Port Forwarding - where we started here) that would be most helpful.

-Glenn

1932. Re: [ntms-hsmm] Re: Asterisk & Port Forwarding

Yahoo group: DAWG-HSMM
Date: 2010-08-06 17:27:20 UTC
From: John (WB5NFC)
Topic: 1880 Message: 1932

Great thoughts, Glen. I just did a first-read of your email. I will be going back over it again (and reading your link), but I wanted to share some information while it is fresh on my mind.

Take a look at http://www.xelatec.com/xipar/iaxrpt

This is a program that provides remote PC IAX connectivity and the push-to-talk capabilities of two-way radio. It's not ported to the iPhone yet, but perhaps someone is listening...

One other thought for those traveling down the VOIP/ROIP/HSMM path: there are several iPhone applications that support SIP and IAX access. I'm still "playing" with these, so I have no particular recommendation. However, I do use the iPhone EchoLink app. Combine it with EchoLink connectivity through Asterisk and you have the basis for a versatile communication system.

Thanks for offering to add a section to your site. I will be happy to contribute what little I know...

73,
John / WB5NFC

From: Glenn Currie
Topic: 1880 Message: 1933

The "push to talk" type interface is tremendously important. The interface is a natural for hams. So it should be an option.

At all of the presentations I have done, there have always been hams that come up to look at the little blue Linksys box. They are expecting to see a mobile rig with a curly cord and mic for their vehicle. There is no reason such an interface could not be an option.

One of the constant problems with VoIP problems is to try to have enough bandwidth that the voice signals do not break up into jerky audio as packets get delayed. The overhead to support half duplex links where the operators expect there to be delays in replies actually taxes the network link less. I would like to be able to have the system work well for as many users as possible. They could just learn the basics to operate in one mode or they may decide to dig in and get to the point where they can do development work. But in any case, for my interest in emergency communications (see the Design Philosophy for HSMM-MESH) the system needs to be easy to set up and use. If you want to learn more, fine, but the idea is to have a system that is a tool that works when needed and one that will usually have the bandwidth to do things that other amateur radio modes cannot.

Many interesting topics. We can start collecting information and see which directions seem the best to invest in. For such an ambitious project, we will need the help and advice of a group of hams. Although a lot of things are quite possible, it takes more than one or two hams to accomplish many of them.

One only has to look at some of the linked repeater systems to see what can be done by a group. It takes time but a coordinated group can make it possible to actually bring large systems together and make them real.

Great thoughts, Glen. I just did a first-read of your email. I will be going

back over it again (and reading your link), but I wanted to share some

information while it is fresh on my mind.

Take a look at http://www.xelatec.com/xipar/iaxrpt

This is a program that provides remote PC IAX connectivity and the push-to-talk

capabilities of two-way radio. It's not ported to the iPhone yet, but perhaps

someone is listening...

One other thought for those traveling down the VOIP/ROIP/HSMM path: there are several iPhone applications that support SIP and IAX access. I'm still "playing" with these, so I have no particular recommendation. However, I do use the iPhone EchoLink app. Combine it with EchoLink connectivity through Asterisk and you have the basis for a versatile communication system.

Thanks for offering to add a section to your site. I will be happy to contribute what little I know...

Subject: Re: [ntms-hsmm] Re: Asterisk & Port Forwarding

Yes it is a hot topic! I you take even a quick look at:

<http://oreilly.com/catalog/9780596009625>

it is clear that it is a very large topic. Users can configure an Asterisk system in many ways. I am one of the original HSMM-MESH developers and it has become clear that even as we push forward with the IP v6 work for HSMM-MESH, many hams would benefit from sharing information on applications. VoIP via HSMM-MESH would be one of the most universally useful applications we could work on.

We could share information via this group or it might be appropriate to set up another group.

Different Asterisk users may have different requirements with what they wish to do with their systems. We started our mesh work to expand our capability with Travis County ARES in the Austin, Texas area. If we were to establish a few conventions, it might make it easier for ARES groups to link their Asterisk

systems and train their members to use the system.

"Soft Phones" using the sound card of a PC and drawing a graphic of a phone on the screen is one of the least expensive ways to get started with Asterisk and VoIP experiments, and using them should always be an option, I am confident that many hams and people in served agencies will be more comfortable with a physical phone and handset. One of the key things is keeping training to a minimum, so the more you can set up a system that works like a "regular" phone, the less training you may need to do. I have found that the abstraction of using a soft phone is unfamiliar and unsettling to many.

Also HSMM and various VoIP projects are a great way to attract new hams. So to push the physical phone / handset idea to the logical end, I want to promote using Wi-Fi based cordless (wireless) handsets. These are available for about $150.00 on up from makers like Polycom. The real push I want to make is to make use of the Wi-Fi subsystem in the modern smart phones such as the Apple iPone and similar Android OS based smart phones. These phones ARE amateur radio transceivers! Users should be able to talk through a HSMM-MESH based Asterisk VoIP system using their iPhone.

There is already a Skype app for the iPhone I understand. We we would want is a Wi-Fi based IP-Phone application that would allow us to link to our mesh based Asterisk systems. A sample configuration would be to use HSMM-MESH as part (possibly the bulk) of a system to link ARES users for a particular event.

HSMM-MESH supports putting a WRT54G into a normal Access Point mode. In this configuration the 54G is no longer a mesh node, it is a normal AP. You plug the AP into one of the LAN ports on a mesh node and provide a normal Wi-Fi link for an area at a particular endpoint. With this normal AP any normal Wi-Fi device can be gatewayed into the mesh. This would include Wi-Fi based VoIP phones.

So soft phones could would be inexpensive and a way for people that are comfortable with them to access the Asterisk system. Wired IP-phones could be used by served agencies and others. And the smart phone crowd could use the

latest phones as amateur radio transceivers to access the system.

The major building blocks are available. For an iPhone app developer, it would be straightforward to spec an application to tie an iPHone into the system. So round up a few iPhone app developers and get them to get their ham ticket and tell them we need them for a cool ham radio project using the latest gear available!

It is an ambitious project but one that is quite doable. Some coordination of effort would yield a great system - one that has many uses and is fun to work with.

While the tie in of the smart phones is icing on the cake, I want to have something in the project to attract the younger crowd of network savvy developers into ham radio.

If you have an interest in any aspect of such an Asterisk project, let me know. We can keep people on this list informed or start a new list to if it seems we are dragging this list off topic too much.

I will be adding a section to the

hsmm-mesh.org

web page to help with the project.

For those that have Asterisk experience with amateur radio, if you could share some of the specifics (such as Port Forwarding - where we started here) that would be most helpful.

It looks like I hit a pretty hot topic with my original post. I can't speak for Dave or Glenn, but since I started the thread, I want to jump back aboard before

I get left in the dust <g>.

In my case, I am looking for specific guidance on how/where to forward the ports necessary for Allstar (ACID), Echolink and IRLP. My mesh is working and supplying Internet access from one node to the next, but Echolink and IRLP nodes cannot connect. Allstar status shows up in "green" and both Echolink and IRLP status pages show that the nodes are online. The CLI shows that the Echolink stations are being downloaded successfully to my box. I suspect that I am misinterpreting just where to forward the appropriate ports on the HSMM Mesh port forwarding page. Once I get this figured out, I will look at activating SIP ... which I think will be easy once I understand more of what I am doing wrong now.

Thanks to all who contribute time and knowledge to this great project!

Subject: [ntms-hsmm] Re: Asterisk & Port Forwarding

Dave & Glenn,

I have a bit of asterisk experience and a fairly good background in port handling. In particular I have successfully set up Echolink in both Windows and Linux systems. Doing this allowed me to make a contact from Dubai to the South Texas balloon at 22 miles up and back down to several ground stations. Super fun!

I agree with Glenn, in order to help we would need to know what Dave is trying to do exactly. Asterisk is a very broad term and covers many options. For example are you trying to be able to route a SIP or IAX connection through HSMM? Are you wanting to use Asterisk as a phone patch from HSMM to the POTS? Are you wanting to use HSMM as an OPX link for Asterisk? Etc.

I want to learn more about this topic myself and would enjoy helping anyone by

sharing what I already know.

1934. Re: [ntms-hsmm] Re: Asterisk & Port Forwarding

Yahoo group: DAWG-HSMM
Date: 2010-08-06 18:18:03 UTC
From: ALERTradio ERC | N0PCO
Topic: 1880 Message: 1934

/Sometimes technology is like a good puzzle, the picture isn't complete without all the pieces. /

To establish connectivity with stations that are using IRLP or EchoLink via the Asterisk RF Gateway you will need to add a couple of items.

Namely the channel drivers

For EchoLink take a look at "Setting up EchoLink Connectivity"

http://app-rpt.qrvc.com/node/56

Ports to open for EchoLink are:

TCP: 5200
UDP: 5198 and 5199

==========

For IRLP take a look at "Setting up IRLP Connectivity"

http://app-rpt.qrvc.com/node/57

Ports to open for IRLP are:

TCP: 15425, 15426, 15427
UDP: 2074-2094 (inclusive)

Details regarding IRLP ports can be found at:
www.irlp.net/ts.html

==========

Be sure that the ports listed above are being forwarded to the private IP address of the Asterisk server (e.g. 44.128.0.50 or 10.1.1.100). Sometimes the obvious gets in the way of success.

==========

There are a number of groups that have been working with Asterisk PBX and RF Gateways for nearly a decade (amazing to think the technology has been around for that long already).

For Amateur radio the best known Asterisk Group is known as the Allstar Link Network (http://allstarlink.org) which is a publicly-accessible (licensed required) Amateur Radio network. Another group that is active in development of networks using Asterisk is called Asterisk Radio Networks (http://asteriskradio.net), that is doing work with the complete Asterisk Communication Tool Chest (PBX and RF Gateways).

Asterisk Radio Networks is fortunate in having the opportunity to work with both Commercial and Amateur Radio networks and systems. The flexibility is indeed awesome.

When looking at HSMM there's some adding options where a complete "stand-alone" system can be created that can extend the last-mile coverage. There some new desk top phones that are available that can act as their own phone server as well as work with existing phone servers. Definitely makes for extremely quick network expansion when needed. Yes, there are a number Wi-FI devices available that can easily be configured, as well as some new devices that have video and voice capabilities (which would be ideal for locations that require verification that a person has arrived / departed) for remote locations.

Asterisk is indeed a Communications Tool Chest with one's imagination being the only limit.

Along the same lines, here is something rather interesting that was recently sent my way.

----------Forwarded Message----------
You should read up about the "mesh potato" stuff on the village telco blog
http://www.villagetelco.org/

They have an embedded system with a wifi mesh network connection and a built in ATA or Analogue Terminal Adapter... to connect regular phones to voip stuff. I'm sure something like that could be modified to link into a repeater. It can run asterisk on the embedded cpu.

see here: http://wiki.villagetelco.org/index.php?title=Mesh_Potato_Features_/_Specs

Glenn

Here is what I want to do with Asterisk. I have just started a Linux project intending to use Asterisk for use on the HSMM-MESH software to act as a private PBX for only the nodes and their LANs to communicate voice and video around the HSMM-MESH net work. There will be 100 mesh nodes with 4 LAN stations on each node. 400 to 500 callable telephone numbers. These will be preassisgned numbers with a web page directory link to make the call. That directory currently resides on each of our 400 stations. You will be making a call to a tactual address of a station, i.e. St. Johns hospital administration, not a call sign or person's name. There will be NO commercial internet linkage over the HSMM-MESH network. We are currently using CX3, which is a Windows program to perform this function, and it works well. We tunneled this since the HSMM-MESH software was not capable of opening a range of ports and could not hand UDL? Ports at that time. I have finally found a Linux programmer and provided him with a reasonable current Dell laptop to host this software. Phones will typically be soft phones or maybe some of them might be network phones. Soft phones hosted by the LAN stations (laptop computers). We have not figured out how to handle web phones, but it is on the investigate schedule.

Does anyone know what ports need to be opened, or do I just tell the programmer to open what the Asterisk manual says. I also understand Asterisk can communicate video as well as audio, but again that is on the investigate schedule. We are using old Netmeeting and it is working well. We may stay there because the software also includes whiteboard, etc features that would be helpful.

Bill,

Thanks for the Asterisk related info. At the hamfest "Summerfest" in Austin over the last two days, I talked with quite a few people that have Asterisk experience. Clearly the system if very flexible and can be configured in may ways. Our goal is to come up with some common configurations that, if followed, will allow ARES organizations to seamlessly link HSMM-MESH based Asterisk systems and talk to each other.

I am already spread very thin on development time but wanted to help coordinate a specific implementation of Asterisk that has published software and hardware guidelines so the systems can inter-operate.

Several people have already offered up very useful information as they have years of experience with Asterisk. I will be adding information to the hsmm-mesh.org web page with the specifics of our Asterisk work. One of the early steps is to get the already experienced Asterisk users to get Asterisk running over HSMM-MESH. We will note any possible changes to HSMM-MESH that might make it easier to support Asterisk and include any such changes in later releases of HSMM-MESH firmware.

We need to discuss using a common CODEC and some specific hardware and provide some detailed written descriptions of how everything is set up so hams from different ARES organizations can have their HSMM-MESH based Asterisk systems work without basic incompatibilities.

The task is relatively well defined and all the major pieces are available. We just need to try out the system and provide some basic info on how many VoIP links can be simultaneously maintained under various conditions.

So the big modules are available, we need to test and document all the specific details so the system will work well, and that will take a while. I plan to let the experienced Asterisk users take the lead and mainly act as a hub to collect and share information. Hams on this active group have an interest but this is not an Asterisk only group so we will cooperate with the moderator and keep the Asterisk postings at a workable level, and post documents and diagrams on the hsmm-mesh.org web page.

It is clear that VoIP is one of the applications most requested to run on top of HSMM-MESH. I think we may have picked up a couple of smart phone developers to do the smart phone apps needed to use Android OS and Apple iPhones on the system. This smart phone part of the project may seem to be icing on the cake and it is to a point but they younger hams were super excited about it and that was one of the key reasons to make it part of the project. They are cooking already.

I a exhausted from the hamfest and must prepare for work related stuff on Monday.

I have been saving all the Asterisk specific suggestions and questions to a file and will organize the information and get some related info on the hsmm-mesh.org page as soon as I can.

Thanks for all the interest and information. The specifics on port forwarding are much appreciated and noted.

Here is what I want to do with Asterisk. I have just started a Linux

project intending to use Asterisk for use on the HSMM-MESH software to act

as a private PBX for only the nodes and their LANs to communicate voice and

video around the HSMM-MESH net work. There will be 100 mesh nodes with 4

LAN stations on each node. 400 to 500 callable telephone numbers. These

will be preassisgned numbers with a web page directory link to make the

call. That directory currently resides on each of our 400 stations. You

will be making a call to a tactual address of a station, i.e. St. Johns

hospital administration, not a call sign or person's name. There will be

NO commercial internet linkage over the HSMM-MESH network. We are

currently using CX3, which is a Windows program to perform this function,

and it works well. We tunneled this since the HSMM-MESH software was not

capable of opening a range of ports and could not hand UDL? Ports at that

time. I have finally found a Linux programmer and provided him with a

reasonable current Dell laptop to host this software. Phones will typically

be soft phones or maybe some of them might be network phones. Soft phones

hosted by the LAN stations (laptop computers). We have not figured out how

to handle web phones, but it is on the investigate schedule.

Does anyone know what ports need to be opened, or do I just tell the

programmer to open what the Asterisk manual says. I also understand

Asterisk can communicate video as well as audio, but again that is on the

investigate schedule. We are using old Netmeeting and it is working well.

We may stay there because the software also includes whiteboard, etc features that would be helpful.

1941. Access to remote PC

Yahoo group: DAWG-HSMM
Date: 2010-08-08 05:23:03 UTC
From: Frank
Topic: 1941 Message: 1941

I have two MESH units named K5FER-Node1 and K5FER-Node2 with a PC connected to a LAN port on each unit. They work just fine and with Node1 connected to the internet thru the WAN port of the LinkSys I can access the Internet from either Node-1 or Node-2. Both are set for DHCP, Node-1 uses 172.27.1.x and Node-2 uses 172.27.0.x. The PC on node-1 is 172.27.1.112 and the PC on node-2 is 172.27.0.208.

I just get time outs when I ping either address.

My question is how do I connect to either PC from the other?

My goal is to place a server and other networked equipment that may be in a water tower on the net so we can gain access all the while being part of the MESH network.

If I understand what you are doing correctly, you are trying to ping the IP of the computer connected to the Linksys from another computer somewhere else on the internet?? If so, you cannot ping the computer on a router from the other side of the router, meaning the internet. You can only ping the router itself. If you want to remotely control the PC connected to the router, you must assign a TCP port to pass thru the router to that particular PC, then use whatever remote program to control that PC. You can only ping another PC if it is on the same router as the one you are pinging from. If you are trying to use something like Desktop Remote, you must port forward the TCP port used by Desktop Remote to the PC you are trying to control. Then connect to the ROUTER's IP address followed by the port # used by the remote application.

For example, if your router was assigned IP 67.18.37.9 by your ISP, you would set desktop remote to connect to 67.18.37.9:3389....NOT the IP of the PC itself! 3389 is the TCP port used by Desktop Remote. This will only work AFTER port forwarding port 3389 to the PC you are trying to connect to. This is done in the router itself, either via the MAC address of the PC or by giving the PC a static IP to the router and assigning it to th the PC's static IP.

If your computer was NOT connected thru a router, and was directly connected to the internet via a cable modem or DSL modem, this does not apply. You can ping the PC directly. (Verizon DSL modems excluded as they are actually 1 port routers)

Of course, I could have easily misunderstood what you were trying to do and this means nothng to your situation...which is probably the case!

1944. RE: [ntms-hsmm] Access to remote PC

Yahoo group: DAWG-HSMM
Date: 2010-08-08 13:02:32 UTC
From: Frank Roesch
Topic: 1941 Message: 1944

I didn't plan to connect to the PC thru the WAN port of the router I just had it connected to prove that the routers did work. Now I have disconnected the WAN connection to the internet. So now I want to go back and forth over the MESH to get to my devices. I have both PC's set for file sharing and one has a shared printer.

Do the MESH routers build routing tables ? If so, Node-1 should have discovered that IP range of 172.27.0.x is over on Node-2 and then routed my ping request over there. In this case I'm trying to go from 172.27.1.112 across the MESH to 172.27.0.208.

Then this leads to a few bigger questions. Let's say that I put up two IP based video cameras on top of a water tower along with a repeater controller along with an EchoLink station, I need to access them from a remote MESH node, then I wanted to access something up in Plano, then I need to access a File server in some other location and then share a file between a server in Rowlett and one down in Austin.

Will the MESH system allow me to access and or share access to any of this equipment over the network and then how do we manage all the IP addresses to prevent duplicates or is the MESH designed as another way to get to the Internet in order to access public systems like Instant Messenger, etc ?

Actually, the same basic thing that Greg told you applies since each MESH node has a firewall and NAT that protects the LAN and WAN from the WLAN (Wireless LAN).

>Do the MESH routers build routing tables ? If so, Node-1 should have

Yes, the MESH routers build up routing tables but basically with routes to the other nodes. And Node-1 will not have discovered 172.27.0.x is over on Node-2 because those addresses are behind Node-1's NAT/firewall. Any packet that came from one of your 172.27.0.x machines, when it gets onto the wireless side, will have the IP address of Node-1's WLAN interface.

It will but not by default. Again, all that equipment is behind a NAT/firewall so you'll have to punch holes in said firewall(s) to allow access to those cameras and rptr. controller from the MESH and well as the Internet, if that MESH is so connected.

I like to think of the MESH as an ISP, just like the one you and your neighbors are using to access the Internet. All of you can access the Internet through a gateway. All of you can probably connect to each other if you can find out their IP addresses BUT.... You and your neighbors, if they have a brain cell or tooth in their heads, will protect their own home networks/PCs with a firewall/NAT. If a neighbor will allow access to a share or printer on his/her home network then he/she will have to punch a hole in his/her firewall for you.

>IP addresses to prevent duplicates or is the MESH designed as another

That's the basic beauty of the way the IP addresses are assigned in the 10.x.x.x range with our OpenWRT firmware configuration. That's roughly sixteen MILLION IP addresses available! While it is entirely POSSIBLE to have a duplicate IP address on a very large MESH, it is VERY UNLIKELY! If it does happen then one of the nodes can have their MESH IP address changed to keep the MESH copacetic.

Does that help, Frank?

You may have made a type in the IP addresses, but they are not on the
same subnet based on the numbers you supplied. If that it intentional,
netmask needs to be 255.255.0.0 not the standard 255.255.255.0.

Glenn-

What are some of the things that you are trying to do with Asterisk? I have been interested in interfacing Asterisk with radio for a while, I just haven't had the time to dig too deep in to it yet. I have quite a bit of experience with Asterisk as far as configuration and setting it up, in both LAN and WAN types of topologies. I run it at my house for my work phone and fax and have for the past 5 years or so. I have seen a couple of guys over the years here and there trying to do different things with Asterisk and PTT type applications, but haven't really seen any end results. I would be interested in hearing what types of projects you have in mind or are working on with Asterisk and helping out wherever I can.

I have had trouble with some spam and repeated messages on my yahoo email. If you have an interest in helping with VoIP applications on HSMM-MESH, let me know.

Thanks for your interest. Sorry if you get the message more than once or I have not replied to some of your previous emails to me.

1955. ARRL/TAPR DCC Early Registration Deadline September 1st

Yahoo group: DAWG-HSMM
Date: 2010-08-30 22:05:34 UTC
From: Mark Thompson
Topic: 1955 Message: 1955

The ARRL/TAPR DCC (Digital Communication Conference) will be held

in the Portland, OR area on September 24 - 26.

----- Forwarded Message ----
From: Steven Bible <n7hpr@...>
To: tapr-announce@...; hpsdr@...enhpsdr.org
Sent: Mon, August 30, 2010 9:06:53 AM
Subject: [tapr-announce] DCC Early Registration Deadline September 1st

The September 1st deadline to register for the DCC and get the best room rates is fast approaching.

The DCC activities planning are in the final stages:

- The DCC Proceedings is over 200 pages! See the list of papers below.
- The speakers schedule is being planned.
- Introductory talks.
- Banquet Speaker
- The Sunday Seminar on DSP Tools, Techniques, and Tricks presented by Rick Muething, KN6KB (see below for abstract)
- Wonderful location at the Heathman Lodge, Vancouver, WA (http://www.heathmanlodge.com)

If you have not attended the DCC, you are missing out on a lot of technical fun. Papers, presentations, demos, meeting like minded people. It is a great event. Ask anyone who has attended one!

To register for the DCC go to http://www.tapr.org/dcc. Hotel registration information is also located there. Be sure to mention the DCC for the discounted rate.

See you at the 2010 DCC!

73, DCC Planning Committee.

Sunday Seminar

DSP Tools, Techniques, and Tricks

Rick Muething, KN6KB

Time: Sunday Sept 26, 8 AM 12 Noon

Prerequisites: An interest in Digital Signal Processing. Some experience in programming may be helpful. The only math you¹ll need is addition, subtraction, multiplication and division and some idea of what a sine wave

is.

Goals: The goal of the workshop is to encourage those peripherally interested in DSP to take the next step to learn what DSP can do and try some DSP design and coding. Each attendee will get a handout CD which will include all slides with links to useful references. The CD will also include some basic Windows VB.NET examples of operational code along with some useful DSP tools (demo versions).

Sessions: Four sessions 45 min each with 15 minute breaks.

1) DSP Intro and Basics: what we are trying to do with DSP. Why is it better/different than analog. The cornerstone of DSP .the Fourier Transform and the FFT.

2) DSP Tools: What you need to see, interpret and understand signals. Basic waveform processing utilities. How do you setup a sound card to capture and play back audio with examples. How to design basic DSP Filters using common tools.

3) DSP Techniques: How do we use DSP to do those things needed in a radio. Mixing, Filtering, Modulation, Demodulation, FSK, PSK, Tone Detection, AGC etc

4) DSP Tricks: Tricks of the trade to make the impractical possible. Common and useful tricks to make significant reductions in computer demands, Single tone detectors, decimation, windowing, CIC Filters, IQ sampling.

No seminar or workshop can cover this topic completely in a few hours but this workshop should remove some of the mystery of DSP and motivate those to learn what can be done and get more involved.

Bio: Rick is a retired entrepreneur electrical engineer and has been a ham since 1962. After volunteering for the Winlink Development effort in 1998 he focused his efforts on programming and DSP. Rick was responsible for the SCAMP, WINMOR and V4 sound card protocols described in the DCC 2004, 2008 and 2010 proceedings along with several of the software components of the Winlink 2000 system.

Proceedings of 29th Annual ARRL/TAPR Digital Communications Conference

Mobile Fading; Sachin Dubey and Kanchan Cecil

RF to Video Converter for Timex/Sinclair Computers; John M. Franke, WA4WDL

1956. Streaming Video at Plano Baloon Festival

Yahoo group: DAWG-HSMM
Date: 2010-09-02 02:14:48 UTC
From: Kipton Moravec
Topic: 1956 Message: 1956

We have been asked to provide video of the launches for the Plano Balloon Festival.

I will have a HSMM-MESH running at the site, so I am looking for a team to get streaming video out to the internet so it can be watched from the Southfork Hotel where the Balloon Festival operations are, and anyone else that wants to watch.

Last year Tony Campbell set up a video camera. attached to his PC, which was hooked into a HSMM-MESH node. It was uploaded to Ustream.com (or something like that) and it was available to whoever wanted to watch.

I need to find some people willing to find a way to either do the same thing or find a better way to do it.

The Plano Balloon festival has Launches:
Friday September 17 at 8:00 a.m. Press Only
Friday September 17 at 6:00 p.m.
Saturday September 18 at 8:00 a.m. Press Only
Saturday September 18 at 6:00 p.m.
Sunday September 19 at 8:00 a.m. Press Only
Sunday September 19 at 6:00 p.m.

The first and last launches are not as important. as the middle 4.

Video not necessary during the day between launches.

Anyone interested in working on this? Let me know.

Kip

1957. Linksys WAP11

Yahoo group: DAWG-HSMM
Date: 2010-09-05 07:33:06 UTC
From: A E
Topic: 1957 Message: 1957

Hi Guys,

I have a Linksys Wap-11 access point, I see several Hams are using this for HSMM Mesh however, I can't seem to find the firmware to upload to this in order to get it to work.

Or am I missing something?

Thanks
Aaron

>Or am I missing something?

Uh, Aaron.... yer missing something. The WAP-11 is strictly 802.11b (not a real big issue) but its also a simple access point with no router capabilities at all. Also, I beleive, it also does not have the memory capacity to be reloaded with new firmware like OpenWRT. Yeah, I know they all look alike with the blue and black box but they are QUITE different. Sorry.

The HSMM-MESH group is using basically WRT54G, WRT54GS, and WRT54GL. The WRT54G and GS's you have to watch which version of the hardware you get because of changes in the amounts of memory Linksys/Cisco put into them at a certain point. Version 5.0 and beyond were essentially crippled. All WRT54GL's are good to buy. Fry's used to carry the WRT54GL but they no longer appear on the shelves, at least in the Dallas and Austin area.

Check out www.hsmm-mesh.org for gobs of information.

1959. HSMM at the Balloon Festival

Yahoo group: DAWG-HSMM
Date: 2010-09-13 16:28:55 UTC
From: Kipton Moravec
Topic: 1959 Message: 1959

I am setting up HSMM at the Plano Balloon Festival at Oak Point Park in Plano.

Normally we have a node at the First United Methodist Church, At the Communications Trailer, at the Operations Tent, and at the Scissor Lift.

I also provide Internet access for the Accounting trailer on a separate network.

We will also be streaming video this year and Doug Kilgore can use some help with that aspect.

Wednesday afternoon I will be setting up the node at the Church.

Thursday afternoon/evening I will be setting up the rest of the network.

During the festival I just monitor the network, but we may need help with video.

Sunday evening everything at the site comes down.

Monday the church site comes down.

Do I nave any volunteers to help with any part at any time?

1960. DCC Forum Schedule Announced for ARRL/TAPR Digital Communications Conference, Portland, OR September 24 - 26

Yahoo group: DAWG-HSMM
Date: 2010-09-21 18:11:04 UTC
From: Mark Thompson
Topic: 1960 Message: 1960

The ARRL/TAPR DCC (Digital Communication Conference)
will be in Portland, OR on September 24 - 26.

TAPR is the national digital ham organization and the DCC is the annual conference.

The DCC Forum Schedule has been published & is available at:
www.tapr.org/pdf/DCC_2010_Schedule2010-09-17.pdf

As you will see there is something for everyone at the DCC including Technical Presentations & Papers

covering Digital Voice, Digital Amateur Television, Softwware Defined Radio & Digital Data and also Introductory Presentations.

The Saturday night banquet speaker will be Dr. Nathan “Chip” Cohen, W1YW.
Yaesu has contributed a VX-8DR HT as a major banquet prize. There will be other prizes as well.

More details about the banquet at: www.tapr.org/dcc#banquet

The Sunday morning Seminar will be conducted by Rick Muething, KN6KB and
will cover DSP Tools, Techniques, and Tricks.
More information about the Sunday seminar at: www.tapr.org/dcc#seminar

Complete information about the DCC is available at: www.tapr.org/dcc

We hope many of you can attend the DCC this year.

You can follow TAPR activities on Facebook & Twitter at
TAPR's Facebook Profile at: www.facebook.com/TAPRDigital &
TAPR'S Facebook Fan Page at: www.facebook.com/pages/TAPR/116614778354245
and on Twitter at: www.twitter.com/TAPRDigital

The Summer 2010 edition of the TAPR PSR Journal is now available at:
www.tapr.org/psr/psr112.pdf

http://www.sigmobile.org/mobicom/2010/demos.html

MobiCom Demos and Exhibits, Chicago, September 20 - 24

The following demos are scheduled to be presented at MobiCom 2010:

ENCR - E-home Sensor Network based on Cognitive Radio
Shen Gu, Luoyi Fu, Xinbing Wang, Hui Yu, Xiaoying Gan (Shanghai Jiao Tong University)

Visible Light Communication on the Wireless Open-Access Research Platform
Cen Liu, Edward Knightly (Rice University)

Multi-Transceiver Free-Space-Optical Communication Structures
Abdullah Sevincer*, Mehmet Bilgi*, Murat Yuksel* and Nezih Pala** (*University of Nevada, Reno, ** Florida International University)

Bit Extraction from Received Signal Strength
Jessica Croft, Neal Patwari, Sneha K. Kasera (University of Utah)

Demonstration of a VOIP call through a cognitive radio network while avoiding primary users
Raghavendra Sathyanarayana, Hannu Tuomivaara, Matti Raustia (University of Oulu)

Automatic channel assignment and topology optimization in multi-radio wireless mesh networks
Krzysztof Grochla, Krzysztof Stasiak, Vasilios A. Siris*, Elias Tragos*
(Proximetry Poland, *Athens University of Economics & Business)

Demonstrating a Dynamic Multi-Channel Access 802.11 Mesh Network Prototype for High Bandwidth Requirements
Shashi Raj Singh, Mehul Motani (National University of Singapore)

GoBike: A Group Communication System for Bikers Based on Smart Phones
Lien-Wu Chen, Yu-Hao Peng, and Yu-Chee Tseng (National Chiao-Tung University)

Guided-Evolving:Convergence to Globally Optimal Load Balance by Distributed Computing using Local Information
Yongcai Wang, Yuexuan Wang, Xiao Qi (Tsinghua University)

Mobile Multimedia Streaming Improvements with Freeze-DCCPâˆ—
Olivier Mehani *^-, Roksana Boreli*^, Guillaume Jourjon*, Thierry Ernst+
(*National ICT Australia, ^Univ. of New South Wales, +INRIA, -Mines ParisTech)

A Demonstration of the Stix Management System for Broadband Wireless Access Networks

Giacomo Bernardi, Matt Calder, Damon Fenacci, Alex Macmillan, Mahesh K. Marina (Edinburgh University)

On-Demand, Deploy-Anywhere Wi-Fi Diagnostics
A.B.M. Musa, Jacob Ericsson (University of Illinois at Chicago)

A Working Single Channel, Full Duplex Wireless System
Jung Il Choi, Mayank Jain, Kannan Srinivasan, Richard Swensson, Philip Levis, Sachin Katti (Stanford University)

Demonstration of IEEE 802.15.5 Low Rate Mesh
Jun Sun Ryu, Gahng-Seop Ahn, Jiho Ryu, and Myung J. Lee (City University of New York)

A Demonstration of a new TCP Congestion Algorithm over LTE and other Challenging Networks
Jingyuan Wang, Jiangtao Wen, Jun Zhang, Yuxing Han (Tsinghua University)

Hijacking Power and Bandwidth from the Mobile Phone's Audio Interface
Ye-Sheng Kuo, Thomas Schmid, and Prabal Dutta (University of Michigan)

An Interactive Simulation of a Distributed Traffic Control System based on a VANET
Hugo Conceicao, Ricardo Fernandes, Pedro Gomes, Michel Ferreira, Ozan K. Tonguz* (University of Porto, *CMU)

Social WiFi - Leveraging Social Networks for Safe Wi-Fi Sharing
Fred Kilbourn, Jacob Ericsson (University of Illinois at Chicago)

Realizing Dynamic Spectrum Sharing For Heterogeneous Wireless Networks
Lei Yang, Zengbin Zhang, Wei Houâ€ , Ben Y. Zhao, Haitao Zheng (University of California, Santa Barbara)

ZiFi: ZigBee-assisted Wireless LAN Discovery

1962. MRC call down test in november

Yahoo group: DAWG-HSMM
Date: 2010-09-25 18:28:04 UTC
From: Robert Ellis
Topic: 1962 Message: 1962

So, I got some email today from the Medical Reserve Corps (http://www.co.collin.tx.us/homeland_security/citizen/mrc.jsp) that includes:

All MRC Members will be contacted and will be expected to acknowledge the notification. Anyone who also wishes to participate in an Evacuation Drill after the initial Call Down test, will need to evacuate their home within 15 minutes of the notification if possible, with their 72hr. kits in hand and be able to rendezvous with other MRC volunteers at our pre-designated location of Myer's Park 7117 County Road 166 McKinney, TX 75071 (972) 548-4792 (families welcome). Map Link: http://mapq.st/h/6-vgJlYNjL
Participants can spend the night in their own tents, or just join the group for dinner. Everyone will eat dinner from their own 72 kit (I might bring hot dogs & buns). We will light a fire (without matches) and have S'mores for desert. Please review the Myer's Park policies attached to this email if you plan to participate in the evacuation drill. HAM radio operators are welcome to bring their radios. The date and time for this Call Down and Evacuation Drill will NOT BE ANNOUNCED prior to the event. Please ensure that all of your contact information has been updated in the MRC database
at: wwwmetroplexvolunteers.com Please do not include any parenthesis, dashes or periods when entering your phone number(s). If you are unable to enter the database by using your first and last name, all together in lower caps, as the User ID and Password (i.e. mariastephens) then please let me know.

Kinda like a field day that you can't prepare for.

It might be interesting for ham members to bring along their hsmm-mesh 'radios'. Virgin Mobile and Clearwire have some devices that could be used to provide internet access for wifi routers, though some might consider 4g/3g internet access cheating. ;)

1963. hsmm-mesh node in Plano w/ mac ending in EA:56:A5?

Yahoo group: DAWG-HSMM
Date: 2010-09-29 04:42:52 UTC
From: Robert Ellis
Topic: 1963 Message: 1963

Does someone have an hsmm-mesh node with a mac address that ends with EA:56:A5?

I was playing with wscan this evening and saw such a node for a little while. (The router I saw it with isn't running hsmm-mesh, and my hsmm-mesh node couldn't see it.) Frankly, since I doubt any of you live near me I'm more inclined to think I saw it because I was modifying wscan.. The output from wscan was a little strange:

```
Sig Rel Ch E              SSID                     MAC      Vendor       5
--- --- -- - -------------------------------- ------------- ------
-56  20  1   HSMM-MESH                        aa:bb:cc:EA:56:A5: Ad-Hoc
-57  80  1   HSMM-MESH                        002369:82AA55 Ad-Hoc
```

The first one is the unknown; the second one is mine. (Initial parts of the unknown mac address have been blocked out in case someone doesn't want that mac address visible on the internet.) The format of the unknown's mac address did not conform with my mesh node, nor with the 10 or so Plano motomesh nodes within range of my house.

Just wondering,
 robert

1964. Restore default WRT54GL firmware

Yahoo group: DAWG-HSMM
Date: 2010-10-02 20:32:03 UTC
From: Neil Addis (WA5JXY)
Topic: 1964 Message: 1964

Any idea how to restore the default firmware in a new WRT54GL ?
I installed the HSMM firmware when I got it, but now I need to replace my home router so I want to revert back to the default until I order another one to replace it for HSMM.

I downloaded the default .bin file from Linksys and then logged into the router HSMM web page and tried the firmware upgrade process but it said it wanted only a .trx file.
I did some research they have a procedure to convert a .trx to .bin but I really dont want to go through all that process via linux.

Anyone already done this that might have already converted the .bin to .trx so I can reload without building and soldering the DB25 etc.?

Oh also I tried to tftp the .bin to it (-i for binary) but it keeps telling me timeout even though I can ping it.

Thanks for any help / suggestions (other than buying another new one!).

1965. development process

Yahoo group: DAWG-HSMM
Date: 2010-10-03 03:46:48 UTC
From: Gerald Pelnar
Topic: 1965 Message: 1965

OK, I'm ready to jump in WAY over my head. I want to learn how the firmware development process works.

I was going to start with the basics from the OpenWRT site. I just wanted to know any pitfalls to avoid, so not to make the learning process any more difficult.

I have a Linux machine running Debian, an overwhelming desire to know how things work and no desire to take too much time from real developers.

1966. Re: [ntms-hsmm] development process

Yahoo group: DAWG-HSMM
Date: 2010-10-11 20:11:23 UTC
From: Robert Ellis
Topic: 1965 Message: 1966

Gerald,

It is probably easiest to approach firmware development for your linksys routers using the hsmm-mesh software. One problem that I've experienced with openWRT is that the latest software available in any particular release (either backfire or kamikaze) isn't guaranteed to work on the routers that I'm using. In contrast, the hsmm-mesh software will work with your linksys routers. So, using the hsmm-mesh source development environment, you won't get a headache finding a tree that will both build and work.

There is some developer documentation for hsmm-mesh available here: http://hsmm-mesh.org/developer-documentation.html. One of the first things that you'll need is access to the svn repository for hsmm-mesh, which is described here: http://hsmm-mesh.org/developer-documentation/86-svnrepos.html. You should probably request both an account/password and a branch. That way, once you get the hang of things, you can submit modifications to the svn repository. ad5oo reviews changes on developer branches before merging them into the main trunk.

Besides working with a code tree that is known to work on the linksys routers, the svn repository also includes a binary cross compiler toolchain (eg, gcc, linker, librariest, etc). When you work with the openWRT svn repository, the cross compiler environment is built entirely from source. In a sense, openWRT is a linux distribution for which you build everything; in contrast, when you installed debian on your computer, the distribution included all the binaries required for the install.

(As an aside, if you are interested in tutorial on building linux, rather than openWRT, from scratch, I'd encourage you to look at http://www.linuxfromscratch.org. There are several different subprojects on this website ranging from the most basic (LFS) to a cross compiler environment (CLFS) which you could use, say, to build linux on an intel system for installation on MIPS processor. But, linuxfromscratch is not openWRT. It can be a good introduction to building software and describes many things that are handled automatically by the openWRT build environment such as:
why a cross compiler build environment is necessary
introduction to utilities that openWRT uses, such as busybox
what needs to change in the build process for an embedded environment as opposed to on a desktop system
Again, linuxfromscratch isn't openWRT and can't be installed on your routers.)

After you download hsmm-mesh from the svn repository, you can build your own hsmm-mesh firmware. With all the pre-compiled tools, software packages, and kernel, the build takes little time. http://hsmm-mesh.org/developer-documentation/87-using-the-imagebuilder.html describes how to do this. (Note that the hsmm-mesh development environment comes with a 'make' perl script, and must be invoked using "./make". Without that '.' you will invoke your systems 'make' binary, and you will not end up with firmware that you can install on your router.

Once you've built your own hsmm-mesh software, and have become familiar with the configuration environment on the router (say, to cause your routers to provide a smaller number of dhcp addresses on the LAN ports where the default is 190), you could modify the hsmm-mesh build environment on your debian system to limit the number of allocated IP addresses to 10 say. In my local tree, the dhcp limit is specified in a number of files:

```
myhost:etc k5osx$ pwd
/Users/gwraidd/HSMM/trunk/files/etc
myhostr:etc k5osx$ grep dhcp_limit config*/_setup{,.default}
config.ap/_setup:dhcp_limit = 190
config.client/_setup:dhcp_limit = 190
config.mesh/_setup:dhcp_limit = 190
config.mesh_ap/_setup:dhcp_limit = 190
config.router/_setup:dhcp_limit = 190
config.ap/_setup.default:dhcp_limit = 190
config.client/_setup.default:dhcp_limit = 190
config.mesh/_setup.default:dhcp_limit = 190
config.mesh_ap/_setup.default:dhcp_limit = 190
config.router/_setup.default:dhcp_limit = 190
myhost:etc k5osx$
```

So, to implement this change, I'd modify the above files and set the limit to 10, and then rebuild the software, and then if my router was ever used at an MRC POD, I might cause some consternation if a switch was ever connected to my router's LAN port. (There are multiple config directories because the routers can be used in different modes, such as an AP, or a mesh node, etc.)

Once you've played with modifying the hsmm-mesh configuration somewhat, you might consider adding your own binaries to the files directory. For example, on a unix system, I often use the 'view' command to give me read-only access to text files. I've been using the vi editor for a long time, and i prefer to look at some files using vi rather than the 'more' or 'less' commands. The 'view' command is simply an invocation of vi with the -R option. So, I created a little script files/bin/view:

```
myhost:~ k5osx$ cat view
#!/bin/bash
exec /usr/bin/vi -R  $@
myhost:~ k5osx$
```

Now, when I build hsmm-mesh firmware, my routers always have a 'view' command that does what I expect, rather than a busybox shell that goes "hunh unh."

From there, you might want to install some additional openWRT packages in your default hsmm-mesh build, or perhaps modify the existing packages in some way. To do that, you'll need to build openWRT from source, but i'll leave that tale for another time.

robert

1967. Request for "Digital Opinions" (What TNC would *you* get?)

Yahoo group: DAWG-HSMM
Date: 2010-10-12 20:00:20 UTC
From: Patrick Soileau ND5C
Topic: 1967 Message: 1967

Greetings!

I'm interested in getting started with Winlink/Paclink and APRS.

In the future, after this gets going, I'd like to become "digitally active" and try some digital modes on both VHF and HF.

In the beginning, what TNC would you recommend (and why)?

(Please note: it's not important to have "one size fits all" and have one TNC for everything, but I was thinking that if it can be done, it might be nice to have just a single model in the shack.)

Along those same lines, are there any that you would avoid?

Please feel free to either reply to the list from which you got this e-mail or reply directly offlist to me at Patrick@... .

Thanks in advance for your input!

73,

Patrick ND5C

Patrick and all,

There will be a Paclink presentation tonight at the McKinney ARC meeting. Some hands on too I believe. Also if you go to the following url there is additional information regarding Paclink and APRS.

1969. Coming to NCTECH?

Yahoo group: DAWG-HSMM
Date: 2010-11-10 03:02:16 UTC
From: kb5ylg
Topic: 1969 Message: 1969

We just started an HSMM interest group in Azle, will be at NCTECH hoping to exchange ideas.

NCTECH 2010

North Central Texas Emergency Communicators' Ham-festival
(A Great Texas Hamfest since 1997!)
November 13, 2010

7:00 AM to NOON
Azle Community Center
404 W. Main Street
Azle, TX 76020

http://www.wc5c.org

Contact Vic Bell KC5WEN at (817)444-5872.

NCTECH is hosted and sponsored by Tri-County Amateur Radio Club WC5C, and is always the second Saturday in November. The Hamfest is located in the Azle Community Center, 404 W. Main Street, in historic Azle, Texas.

Vendors are welcomed: One of the features of our hamfest is the Swap Meet area, a veritable Ham Radio and High Tech flea market, with new and used Amateur Radio bargains. Indoor tables are $10 each (paid in advance, $13 at door). Outdoor flea market space is free.

Presentations: Presentations are made by Disaster and Emergency Communications organizations and by Ham Radio clubs and experts. Sign up early to make your presentation!

Exam Sessions: A W5YI and/or ARRL Volunteer Examiner Exam Session starts at 9am, be sure to bring your photo ID, pencil and non-programmable calculator. Get prepared by taking a class in advance or self study! Click here for class information.

Organization Outreach: For Amateur Radio clubs and for Disaster Relief agencies wishing to set up a non-sales table to display information about your organization and achievements, or to conduct voluteer and membership drives, Indoor Tables are Free (limit 1 per organization)!

Parking: Parking is FREE!

Directions: Area maps to NCTECH <= click to load maps

Talk-In: 147.160 CTCSS 110.9 as WC5C

1970. New QAM Modem IC

Yahoo group: DAWG-HSMM
Date: 2010-11-11 15:12:38 UTC
From: jks19714
Topic: 1970 Message: 1970

I was "digging around" last night on CML Micro's website when I came across a new (to me, anyway) IC, the CMX7163. It is an I/Q-interfaced QAM Modem capable of 4-, 16- and 64-QAM modulation/demodulation at up to 64 kbps in a 25 kHz channel.

http://www.cmlmicro.com/Products/index.asp?/Products/WData/CMX7163.htm

Pretty intriguing little device. Runs on an SPI interface.

Do you think FCC would be OK with operations in this mode down as low as 6-meters? Wouldn't it be interesting to have a fairly long-haul system with 64 kbps trunks? Even on 222 MHz perhaps? :-)

Just thinking out loud for the moment. Wonder how much they would want for a pair of eval boards?

73,
john W3JKS/AAT3BF/AAM3EDE/AAM3RE/AAA9SL

1971. Vendor lineup for this Saturday's Hamfest

Yahoo group: DAWG-HSMM
Date: 2010-11-11 22:28:30 UTC
From: kb5ylg
Topic: 1971 Message: 1971

We completed the TECH class at Silver Creek Baptist Church in Azle, and got a few new hams out of it.

We have some great commercial vendors, flea market vendors, doorprizes and programs for NCTECH on Saturday.

Commercial Vendors signed up: Austin Amateur Radio Supply, Jubilee Enterprises, Main Trading Company (all three above deal in main stream transceivers, antennas, tuners and general Ham supplies), ABR and Wireman (both deal with coax and feedlines), Force 12 (Antennas) and I think a couple of others. There will be several flea market type vendors, too.

Organizations and Agencies:
Parker County Office of Emergency Management, Kno What 2 Do, AmSAT, MARS, Lonestar DX, Tri-County ARC, Lockeed ARC, DiRECT (Disaster Relief Emergency Communication Team), ARRL North Texas Section, ARRL West Gulf Division, and others

There will be a VE exam session starting at 9am.

From: Steve W3AHL
Topic: 1970 Message: 1972

On 6 & 2M the data rate may not exceed 19.6 kilobaud and maximum BW is 20KHz, per FCC 97.307(f)(5).

On 70 cm the limit is 56 kilobaud and BW is 100KHz

Above 70cm there are no specific limits.

Well, I was thinking of applying for a waiver to the Commission -- it seems to me that the FCC rules are a little antiquated with respect to limiting the signaling rate when you can still fall within the channel bandwidth limitations. Plenty of room around here on 222!

Topic: 1970 Message: 1974

I have'nt studied the rules, but if they do in fact state 19.6 kiloBAUD then that might not be too bad.

Don't forget that 16QAM modulation puts 16 bits per baud. That would give a throughput of 313 kiloBITs per second. In most protocols that would give you about 27 KBytes/sec. Not enough for video but plenty for very high quality audio (e.g., OGG or MP3). If you compress a bit you could cram in three channels of 8K Speex or Low quality OGG.

Of course the 56k would be nearly 80KBytes/sec. Crank that to 64QAM and you get decent video.

Just my 2 cents.

1975. John Champa K8OCL, SK

Yahoo group: DAWG-HSMM
Date: 2010-11-14 21:50:21 UTC
From: Kilgore
Topic: 1975 Message: 1975

November 12, 2010
John J. Champa K8OCL passed away at his home in Richardson, Texas, after a valiant effort to overcome a malignant tumor. John?s wife, Karen, indicated that cremation will take place privately and that she will announce further plans in a few days.

John Champa was a past president of the Richardson (TX) Wireless Klub (http://K5RWK.org) and was a member of the North Texas Microwave Society (HSMM). The loss of his knowledge, experience, and ever-pleasant disposition leaves a significant void in the hearts and minds of his many friends and colleagues.

Attached is a PDF about John.

Lloyd was one of my most patient Elmers. His kind tutelage in microwave technology taught me much more than just microwaves. In his world 100 mW was often QRO and the value of good matching and proper antenna design and attention to detail was critical. Those skills transfer well to any frequency. His kindness and inclusion was exemplary.

I will miss him.

I assume you are staying analog on the air link to the walkies....correct?

There are several instamces of people using ASTERISK (PBX) to interconnect repeaters digitaly.....of course you would need to include the A/D interface HW.

Building on the idea of running Asterisk on one of the DD-WRT nodes OR on a small Linux box on-net, you could use Grandstream SIP phones as your audio interfaces and then the built-in intercom/paging features:

http://www.voip-info.org/wiki/view/Asterisk+Grandstream+Paging

Some assembly required. :-)

I'm setting up something similar in my Mobile Communications Unit project at the moment.

1984. Local - Your Webinar Invitation: Join us for "802.11 Networking with HSMM-MESH(tm) Software"

Yahoo group: DAWG-HSMM
Date: 2010-12-29 23:23:31 UTC
From: Kilgore
Topic: 1984 Message: 1984

Special note for North Texas hams:
The seminar will be conducted at the Lucas Fire Department training room, 165 Country Club Rd, Lucas, TX. Doors will open at 8:00am for set up. Those hams wishing to attend the seminar in person should contact Kip Moravec AE5IB at kip@.... Seating is limited.

802.11 Networking with HSMM-MESH(tm) Software

Join us for a Webinar on January 8

(https://www1.gotomeeting.com/register/336778289)

Space is limited.
Reserve your Webinar seat now at:
https://www1.gotomeeting.com/register/336778289

This webinar is an online version of a 802.11 wireless networking training seminar conducted by Kip Moravec AE5IB and Rusty Haddock AE5AE in the North Texas area at Lucas, TX. Seminar will include an introduction to wireless networking and the HSMM-MESH(tm) software developed for use on Linksys WRT54GL wireless router. Instructions for replacing the Linksys firmware with the new firmware will be given.

HSMM-MESH(tm) is a high speed, self discovering, self configuring, fault tolerant, wireless computer network that can run for days from a fully charged car battery, or indefinitely with the addition of a modest solar array or other supplemental power source. The focus is on emergency communications.

The latest version of HSMM-MESH(tm) is available for download at:
http://HSMM-MESH.org

A Yahoo group for HSMM in the North Texas area is:
http://groups.yahoo.com/group/ntms-hsmm/

The Yahoo group for HSMM in the Austin area is:
http://groups.yahoo.com/group/Austin_HSMM_Development

Title:

802.11 Networking with HSMM-MESH(tm) Software

Date:

Saturday, January 8, 2011

Time:

9:00 AM - 12:00 PM CST

After registering you will receive a confirmation email containing information about joining the Webinar.

System Requirements
PC-based attendees
Required: Windows® 7, Vista, XP or 2003 Server

Macintosh®-based attendees
Required: Mac OS® X 10.4.11 (Tiger®) or newer

From: Robert Ellis
Topic: 1988 Message: 1989

The netgear 614v6 seems to have only 1M of flash, as noted here:
http://www.dd-wrt.com/wiki/index.php/Known_incompatible_devices#List_of_Incompatible_Devices
(While this page lists incompatible devices for DDWRT, which is not HSMM-MESH, it does list why some aren't supported, such as the 1M flash in the 614v6's case.)

HSMM-MESH needs a minimum of a 4M flash.

The list of routers on which hsmm-mesh is supported can be seen here:
http://hsmm-mesh.org/download/firmware/index.html

Not seen on this page are the particular versions of the hardware on which HSMM-MESH is supported. For example, WRT54Gv5 has a 2M flash, and HSMM-MESH is not supported on that model. Unfortunately, I don't know of a web page which states which versions of a particular router are supported.

I do know that HSMM-MESH is supported on all versions of the WRT54GL.

Just because HSMM-MESH isn't supported on the 614 doesn't mean you can't use it. You may find it useful, in some future field day event, to connect one of your 614s to an HSMM-MESH node with an ethernet cable, providing access to an HSMM-MESH network for a bunch of laptops.

fyi,
robert

Hi Paul,
I've wondered the same thing. On the basis of things, it appears that the Netgear WGR614L is modifyable in the same manner as the Linksys Wi-Fi routers as the basic hardware is there. Similar loads for the WGR exist on MyOpenRouter.com (DD-WRT, Tomato, OpenWRT) as used in the Linksys router. Whatever modules needing to be added in for hsmm use can probably just be recompiled into the image and executed. I just have not had the opportunity to download new firmware on my WGR as my work and personal life have been busy of late.

From the answers I received, it appears that there are hardware limitations on the Netgear units I have.

The reason I had the netgear in the first place was (are you ready for this) was to split a Dial-up connection for the XYL and myself. At thanksgiving we got a MiFi unit from Sprint is that ever fast compared to dial-up.

From: Glenn Currie
Topic: 1988 Message: 1992

The Netgear WGR614L is not directly supported by HSMM-MESH.

Look closely at the binary code on hsmm-mesh.org. Other VERY similar hardware is supported. All the supported routers are based on the same chip. The build tools are set up to build code based on the core chip a router is based on.

We have one user that has made use of the binary for a Motorola branded wireless router. The binary is on the web page, but he found he had to change the header in the file to get it to load into the "improved" Motorola hardware.

For a number of reasons the developers have chosen to focus on the WRT54G series of wireless routers at this time. The code could run on other hardware, but it we are faced with resource constraints.

If someone wants to port to other hardware, they are welcome to go for it. If you do the port, you will become the expert on that version of the code. It can be done. The question has been asked many times over the past years, and so far, no one has successfully ported to other hardware and checked their source code back into the source code control system.

So other hardware can be supported but porting the code is not an easy task. There are hundreds of changes to the original code and it takes a while to get the build system set up, make all the necessary changes, get the code checked in - and field test it, before formal release. We are tapped out supporting the current hardware.

We would like to port the code to new hardware and the Ubuiqiti line of equipment seems the way to go for a number of reasons.

See:

<http://www.ubnt.com>

All of us or volunteers. So work on what interests you. We get used but working Linksys WRT54G series routers from the local second hand store, Goodwill Computer works for $27.01 including tax, and have a long feature list to add to the code, so it has not seemed worth the effort to port hardware for our needs. We are hard pressed to try to support the current hardware.

I wish we could support all the workable hardware, but we just do not have the resources at this time.

I was told at the Webinar that the $40 Ubiquiti device was end of life,
but the $80 Ubiquiti device was continuing.

Dave is working on getting the HSMM-MESH software to work on it next.

Rusty is working on an Airlink model that Fry's was selling new for less
than $25. It is also a different chipset than the Broadcom chipset,
which could open HSMM-MESH up to a wider set of routers.

I'm wiring my new office location and I want to piggy back 2 telco lines in with my ethernet cat5e cable. I've must have looked at a dozen web pages telling me how to do this. Now I'm terribly confused. Suggest to me what the pinout to color wire ought to be please.

I would just run a 2nd cat5 cable if you can.

Your asking for cross talk nightmare.

What Speed do you what to run at 10,100,1000?

tnx. that's what I had planned to do in the first place until somebody suggested doubling up. I have about 250' of cat5e so I have plenty of cable.

Jerry
